SUMMARY

Low-carbon economy is pivotal to sustainable development, given the potential impacts that may result from Global Warming and Climate Change. Thus, means for allying economic development with protection of the climate system have been increasingly sought.

Founded in May 22, 1952, the Minas Gerais State Energy Company – CEMIG participates in more than 170 companies as well as in consortia and holding funds. This Brazilian group from the energy sector is widely recognized among employees, suppliers, shareholders and the society for its sustainable activities, having been a member of the Dow Jones Sustainability World Index (DJSI World) for 21 consecutive years. Since 2014, CEMIG’s impacts on the global climate system have been managed through inventorying of its greenhouse gas (GHG) emissions. The present report evaluated the company’s GHG emissions in 2020.

In 2020, CEMIG’s direct emissions (Scope 1) totaled 11,419.36 tCO₂e; emissions from electricity consumption and from losses in energy transmission and distribution (Scope 2) totaled 448,083.41 tCO₂e; and indirect emissions (Scope 3) totaled 5,246,667.72 tCO₂e. All these emissions are detailed in Table 1:

Table 1. Results of GHG emissions by scope and category in 2020 (tCO₂e)

Scope	Category	Emissions (tCO ₂ e)	Representativeness (%)
Scope 1	Stationary combustion	198.43	1.74%
	Mobile combustion	7,927.83	69.42%
	Fugitive emissions	3,262.22	28.57%
	Land-use change	30.88	0.27%
	Total Scope 1 emissions	11,419.36	-
Scope 2	Electricity consumption	2,385.87	0.53%
	Losses in T&D	445,697.54	99.47%
	Total Scope 2 emissions	448,083.41	-
Scope 3	Purchased goods and services	43.45	0.00%
	Employee commuting	173.95	0.00%
	Waste generated in operations	1,004.05	0.02%
	Downstream transport and distribution	20,989.83	0.40%
	Upstream transport and distribution	808.04	0.02%
	Use of sold goods and services	5,223,549.59	99.56%
	Business travel	98.83	0.00%
	Total Scope 3 emissions	5,246,667.72	-

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

The company's Scope1 emissions were mostly associated with consumption of diesel oil for Mobile Combustion (69.42% representativeness). Scope 2 emissions, on the other hand, derived mostly from Losses in Transmission and Distribution (T&D) (99.47%). As for Scope 3 emissions, they were predominantly associated with the category Use of Sold Goods and Services (99.56%), due to the high amounts of electricity and natural gas commercialized by the company.

CEMIG D was the main emitter of both Scope 1 (79.01%) and Scope 2 (97.26%) emissions. CEMIG GT and GASMIG contributed equally with Scope 3 emissions (between 35% and 36%), followed by CEMIG D (29%).

Data on emissions by scope and by operating unit are shown in Table 2:

Table 2. Results of GHG emissions by operating unit in 2020 (tCO₂e)

Operating unit	Scope 1 (tCO ₂ e)	Scope 2 (tCO ₂ e)	Scope 3 (tCO ₂ e)
CEMIG D	9,022.49	435,805.59	1,532,598.56
CEMIG GT	2,008.20	11,620.99	1,821,184.80
CEMIG SIM	1.19	0.00	1.24
GASMIG	360.77	20.27	1,892,883.13
CENTROESTE	26.71	636.56	0.00
Grand Total	11,419.36	448,083.41	5,246,667.72

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Reforestation (tree planting in Cerrado [Brazilian savanna] and Atlantic Forest areas) accounted for a total removal of 25,756.76 tCO₂ in 2020, with CEMIG D being responsible for the sequestration of 16,250.71 tCO₂ (63% of removals) and CEMIG GT for the remaining 9,506.06 tCO₂.

1. INTRODUCTION

The problems arising from Global Warming and Climate Change render low-carbon economy a pivotal issue for sustainable development. For that, means for allying economic development with protection of the climate system have been gaining increasing attention.

Having been signed by several countries in the annual event hosted by the United Nations Framework Convention on Climate Change, the 2015 Paris Climate Agreement aims to restrict global warming to 2 °C – ideally 1.5 °C. For that, all government levels, as well the private sector, must commit to setting bold short- and long-term targets that are in line with the creation of a zero net emissions future. This will require reducing to the closest as possible to zero all the emissions caused by anthropic action, such as those resulting from vehicular and industrial activities that utilize fossil fuels.

In that sense, it is of extreme relevance to quantify and manage greenhouse gas (GHG) emissions in the corporate environment by means of the GHG Emissions Inventory, an instrument which allows for knowing the profile of emissions resulting from the company's activities.

Elaborating a GHG Emissions Inventory has the following objectives:

- **Monitoring of GHG emissions:** Follow up and record the progress of emissions over time, which enables the identification of opportunities to gain operational efficiency and reduce costs;
- **Benchmarking:** Compare the emissions from each operating unit or from each sector of an organization;
- **Assessment of risks and opportunities:** Identify and mitigate the regulatory risks associated with future obligations related to carbon pricing or emission restrictions, as well as evaluate potential cost-effective opportunities for reducing emissions;
- **Target setting:** Subsidize the setting of targets to reduce GHG emissions and the planning of mitigation strategies;
- **Follow-up of results of mitigation measures:** Quantify all progress and improvement derived from strategic initiatives related to Climate Change;
- **Enrollment in climate footprint disclosure programs:** Allow for disclosing information on the company's climate performance (e.g. GHG Protocol, CDP, Corporate Sustainability Index (ISE), and Carbon Efficient Index (ICO₂)).

When applied to a company's value chain, the inventory also allows for an evaluation of the climate sustainability of external processes; e.g., production of raw material, use and disposal of products, and logistics of distribution.

Of the protocols and standards available to compile corporate GHG Emissions Inventories, the following were adopted in the present study:

- NBR ISO 14064 Standard; Brazilian Association of Technical Standards, 2007 (ABNT, 2007);
- Specifications in the Brazil GHG Protocol Program; Verification Specifications in the Brazil GHG Protocol Program; GHG Corporate Protocol – Brazil GHG Protocol Program (PBGHGP) – Fundação Getúlio Vargas; and World Resources Institute (FGV/GVces; WRI, 2011).

The protocols listed above have international credibility. The main reason to adopt them was to produce a report that would be comparable by both national and international standards.

It is worth noting that this inventory is subject to external assurance in compliance with the abovementioned protocols. The objective of third-party assurance is to obtain an independent statement on the quality of the inventory and on the consistency of the information contained in it, aiming to ensure to its users an accurate evaluation of the emissions standards of the company's value chain.

2. ADOPTED METHOD

The 2020 CEMIG's GHG Emissions Inventory was produced using CLIMAS¹, a calculation software developed by WayCarbon.

2.1 Accounting and reporting principles

The following principles guided the performance of this study, according to the guidelines of the Brazil GHG Protocol Program (FGV/GVces; WRI, 2011):

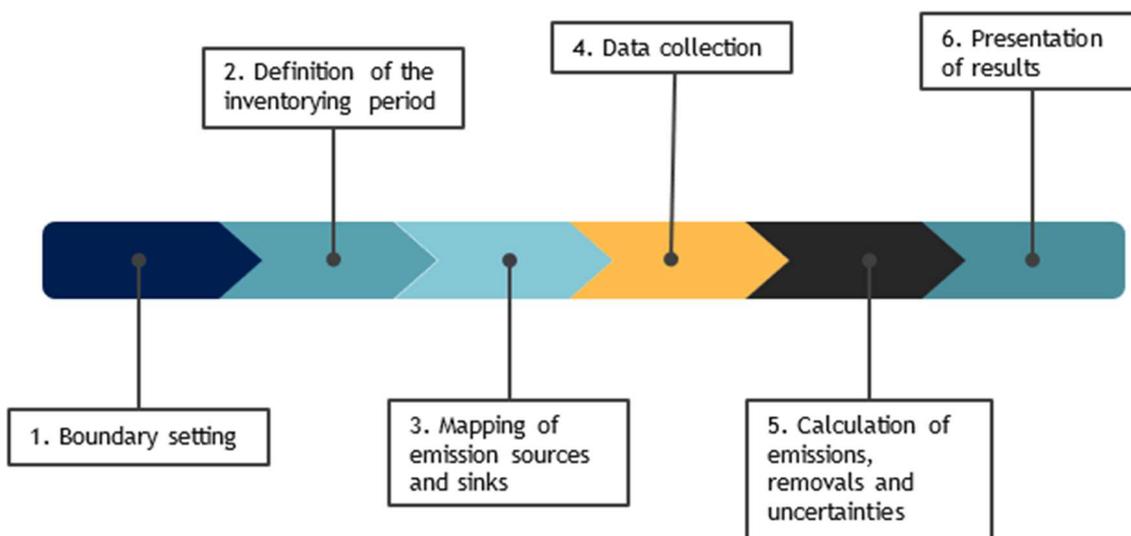

- **Relevance:** Ensure that the GHG Emissions Inventory properly reflects the emissions by the analyzed process and that it meets the decision-making demands of its users.
- **Completeness:** Record all GHG emission sources and activities within the boundaries selected for inventorying. Document and justify any specific exclusions.
- **Consistency:** Use recognized and technically substantiated methods that allow for comparing the compiled emissions with emissions from other similar processes. Clearly document any alterations in the data, inventory boundaries, adopted methods, or other relevant factors for the analyzed period.
- **Transparency:** Treat all relevant issues coherently and factually, grounded on objective evidence. Disclose any relevant supposition, and make proper reference to the adopted calculation and recording methods, as well as to the data sources used.
- **Accuracy:** By means of using appropriate data, on either emission factors or estimates, ensure that the quantified GHG emissions are not under or overestimated. Reduce bias and uncertainty to the lowest possible level and obtain a degree of assurance that allows for safe decision-making.

¹ CLIMAS is a GHG Emissions Inventory calculation software developed by WayCarbon that has a database with the most up-to-date emission factors available for each source type (e.g., Brazil GHG Protocol Program, for Brazil; and, when unavailable, internationally accepted references, such as the GHG Protocol, IPCC, EPA, and DEFRA).

2.2 Stages of inventorying

The conceptual stages used to compile this inventory are presented in the following flow chart and explained further below (Figure 1):

Figure 1. Flow chart of the methodological stages of inventorying

Source: Elaborated by the WayCarbon team.

First, the boundaries are set (Stage 1), i.e., the company's installations and activities that will be evaluated in the inventory are defined, thereby establishing the organizational boundary. Then, the reference period and base year are determined (Stage 2).

The GHG sources and sinks of the company are then identified (Stage 3) and later categorized and ranked. Posteriorly, data is collected (Stage 4). The collected data on emitting activities are used to calculate emissions (Stage 5), as are the emission factors (see below). At this stage, the inventory's uncertainties are also calculated. Lastly, results are compiled in an annual report (Stage 6).

The abovementioned stages were applied to the CEMIG GHG Emissions Inventory following the procedure described in the following sections.

2.3 Boundary setting

2.3.1 Organizational boundaries

There are two possible approaches to consolidate emissions and removals at the organizational level. Each of these approaches are defined below. The one used in this inventory is indicated.

Equity share: The organization accounts for GHG emissions from operations according to its share of equity.

Operational control: The organization accounts for 100% of GHG emissions from operations over which it has operational control.

In Minas Gerais state, CEMIG supplies energy to 8.6 million customers from 774 municipalities. The company's operations include energy generation, transmission and distribution; energy solutions; natural gas exploration and distribution; and data transmission, as shown below (CEMIG, 2021):

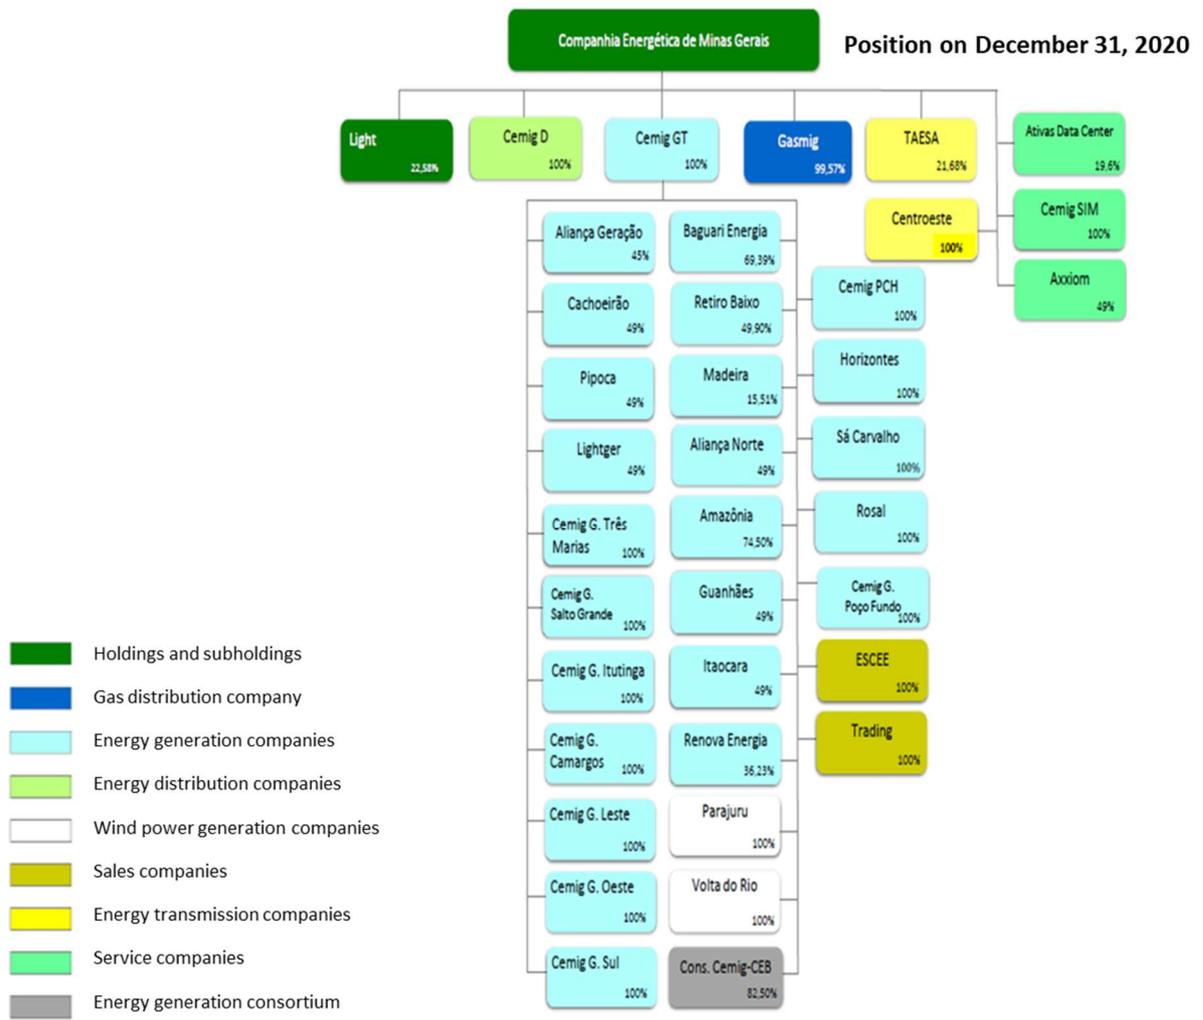

- **Generation:** 5.9 MW of installed capacity
- **Transmission:** ca. 10,000 km of transmission lines
- **Distribution:** the largest distribution network in Brazil, covering 96% of Minas Gerais state
- **Gas:** 1,129,652,727 m³ sold in 2019 (CEMIG, 2020)

The CEMIG group currently holds shares in 89 power plants, of which 86 are hydroelectric, one is solar, and two are wind farms. The Igarapé TPP² was deactivated in 2019 (CEMIG, 2021).

The CEMIG corporate organization chart is shown below (Figure 2 and Table 3):

² TPP: Thermal Power Plant

	Axxiom S.A.	No	49%
Subholding	Light S.A.	No	22.60%

Source: Elaborated by the WayCarbon team based on the CEMIG corporate organization chart.

Despite holding 100% of equity share, Sales companies (ESCEE S.A. and Trading S.A.) were not considered in the GHG emissions inventory, as CEMIG has no operational control over them. As for CEMIG Geração Poço Fundo, which also holds 100% of equity share, its emissions were accounted for within the emissions of CEMIG Geração e Transmissão S.A. (CEMIG GT).

Centroeste S.A. is an energy Transmission company over which the CEMIG group now has operational control, and it has thus been included in the 2020 GHG Emissions Inventory. Thus, the present Inventory accounted for the emissions of the following operating units (Table 4):

Table 4. CEMIG's operating units considered in the 2020 inventory

Operating unit	Operational control	Equity share (%)
CEMIG Geração e Transmissão S.A. (CEMIG GT)	Yes	100%
CEMIG Distribuição S.A. (CEMIG D)	Yes	100%
CEMIG SIM S.A.	Yes	100%
GASMIG S.A.	Yes	99.57%
CEMIG Geração Camargos S.A.	Yes	100%

2.3.2 Operational boundaries

The setting of operational boundaries takes into consideration the identification of GHG sources and sinks associated with the operations, by means of their categorization as direct or indirect emissions, employing the concept of Scope. Below, each of the three categories adopted by the GHG Protocol are defined, and the ones assessed in this inventory are indicated.

- Scope 1: Direct GHG emissions from sources that either belong to or are controlled by the organization.
- Scope 2: Indirect GHG emissions from purchased electricity that is consumed by the organization.

 Scope 3: A category whose reporting is optional; it encompasses all other indirect emissions that are not considered under Scope 2. Scope 3 emissions result from activities of the organization, but derive from sources that do not belong to or are not controlled by it.

2.3.3 Covered period

The present inventory covers emissions from activities held by CEMIG in 2020 (January 1st, 2020 through December 31st, 2020).

2.3.4 Base year

Base year is the reference timepoint in the past against which current atmospheric emissions can be consistently compared.

Recalculations must be retroactive to the base year whenever there is any change that lead to either increase or decrease in emissions, i.e., whenever the alteration compromises the consistency and relevance of analyses over time. The following cases may result in the need for recalculation of emissions:

- Significant structural changes that alter the inventory's boundaries: (i) mergers, acquisitions and divestments; (ii) outsourcing and insourcing of emitting activities; and (iii) change of the emitting activity to either inside or outside the geographical limits of the Program (GHG Protocol Brazil);
- Significant changes in the calculation method, or improvements in the accuracy of emission factors or activity data that result in a significant impact on the base year emissions data;
- Discovery of significant errors, or a number of cumulative errors, that lead to a significant change in the results.

In 2014, the Igarapé thermal power plant was activated with higher frequency, and its operational emissions then increased. As this unit started to burn a large volume of fuel oil, the Scope 1 emissions profile of the company changed thereafter.

In 2018, CEMIG set two targets of tCO₂e emissions. The first one consists in an absolute target based on the combined emissions from Scopes 1 and 2, while the second is an intensity target for Scope 2 emissions, based on emissions from total Losses in Electricity Transmission and Distribution. For that, 2022 was set as target year whereas 2017 was established as base year for total emissions.

The company has also been working on establishing a Science-Based Target (SBT), in which it commits to limiting global warming to a level below 2 °C. The base year will be determined according to the reduction to be projected by the SBT method.

2.3.5 Greenhouse gases

According to the Brazil GHG Protocol Program, inventories must report emissions of the 7 types of GHGs that integrate the Kyoto Protocol: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), sulfur hexafluoride (SF₆), and nitrogen trifluoride (NF₃). Additionally, the Montreal Protocol includes ozone-layer depleting gases such as hydrochlorofluorocarbons (HCFCs), which also contribute to global warming.

Each GHG has an associated Global Warming Potential (GWP), which measures how much each gas contributes to global warming. The GWP is a relative value that compares the warming potential of a given amount of gas with that of the same amount of CO₂, which by convention has a GWP value of 1. GWP is always expressed in terms of CO₂ equivalent – CO₂e. Table 5 shows the GWP values used in the inventory:

Table 5. GWP of greenhouse gases

Gas	GWP
Carbon dioxide (CO ₂)	1
Methane (CH ₄)	25
Nitrous oxide (N ₂ O)	298
Sulfur hexafluoride (SF ₆)	22,800
Nitrogen trifluoride (NF ₃)	17,200
PFCs	7,390 – 17,700
HFCs	12 – 14,800
HCFCs	5 – 14,400

Source: PBGHGP, 2020.

The CEMIG 2020 GHG Emissions Inventory considered emissions of CO₂, CH₄, N₂O, and SF₆ according to the mapped emission sources and available data. Additionally, the inventory also recorded the CO₂ emissions from biogenic sources³.

The gases CO₂, CH₄, N₂O, and SF₆ are generated at CEMIG through the following processes:

- CO₂: Generated in the burning of fossil fuels (such as diesel, natural gas, kerosene, and liquefied petroleum gas) by mobile and stationary sources. CO₂ emissions at CEMIG may also derive from waste treatment and use of agricultural fertilizers;
- CH₄: Generated in the burning of fuels by mobile and stationary sources; as fugitive emissions in the natural-gas distribution lines; and by organic matter decomposition in organic waste treatment processes;
- N₂O: Generated in the burning of fossil fuels (such as diesel, natural gas, kerosene and liquefied petroleum gas) by mobile and stationary sources. N₂O emissions at CEMIG may also derive from waste treatment and use of agricultural fertilizers;
- SF₆: Resulted from the leak of insulating gases.

2.3.6 Exclusions from the inventory

The Generation units CEMIG PCH, Camargos, Itutinga, Leste, Oeste, Salto Grande, Sul, Três Marias, Horizontes, Rosal, Sá Carvalho, Parajuru, and Volta do Rio record only the diesel oil consumption by generators (Scope 1 – stationary combustion), fuel consumption by fleet (Scope 1 – mobile combustion), fertilizer consumption (Scope 1 – land-use change), and commercialization of electricity (Scope 3 – use of sold goods and services). The other data (employee commuting, fugitive emissions, purchased electricity, generated waste, upstream transport and distribution, and business travel) were thereby accounted under the emissions from CEMIG GT.

Refrigerant gas emissions were also excluded from the Inventory, since the 2020 data from that category showed low traceability. The same goes for the leak of SF₆ in the Generation category. Both these cases represent opportunities for improvement in the Inventory of the next year.

³ Biogenic Emissions in the GHG Emissions Inventory – CO₂ emissions resulting from the energetic use of biomass of renewable origin. In this study, the adopted definition of renewable biomass was the one elaborated by the Executive Board of the Clean Development Mechanism of the United Nations Framework Convention on Climate Change (EB 23, Appendix 18). This type of emission does not contribute to a long-term increase in CO₂ concentrations in the atmosphere, as it is part of the natural carbon cycle.

The operating units CEMIG PCH S.A. and Horizontes Energia S.A. have no control over fleet-related information, as their fleet is entirely outsourced. Therefore, indirect emissions (Scope 3) associated with fuel consumption in such transport type were not accounted for. Analogously, the Generation units have no control over the amount of fuel consumed by sporadically used outsourced ships.

LPG consumption by forklift trucks (Scope 3 – purchased goods and services) as well as the gasoline, alcohol, diesel and VNG consumption by contractors (Scope 3 – downstream transport and distribution) are all applicable only to CEMIG D.

Emissions derived from domestic waste (Scope 3 – Waste Generated in Operations) were not recorded at the energy Generation units (CEMIG PCH, Camargos, Itutinga, Leste, Oeste, Salto Grande, Sul, Três Marias, Horizontes, Rosal, Sá Carvalho, Parajuru, and Volta do Rio), since control over this data is still under development.

2.4 Identification or revalidation of sources and sinks

Emission sources were identified and ranked within the company’s organizational structure. In the CLIMAS system, developed by WayCarbon, emission sources were mapped and each one was classified according to the attributes described below (Table 6):

Table 6. Description of attributes recorded for the input information database

Attribute	Description
Operating unit	Indicates the operating unit to which the source or sink belongs
Process	Indicates the process to which the source or sink belongs
Activity	Indicates the activity performed by the source or sink
Supervised item	A field where further details for identifying the source of emission are reported
Precursor	The substance which will originate the GHG emissions
Technology	The precursor-associated technology which originates GHG emissions
Operating parameter	Description of the input data
Unit of measurement	Unit of measurement of the consolidated input data
Responsible	The company’s staff member which is in charge of data collection
Data source	The site, registry, reference or system from which the data is retrieved
Scope	Scope of the emission source, according to the GHG Protocol classification
Category	Category of the emission source, according to the GHG Protocol classification

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

The emission sources accounted for in the inventory, according to the ranking and organization elaborated in CLIMAS, are shown in Table 7.

Table 7. Emission sources in the inventory by scope, category and controlled data

Scope	Category	Controlled data
Scope 1	Stationary combustion	Natural-gas consumption by stationary sources
		Diesel oil consumption by generators
	Mobile combustion	Diesel consumption by ships
		Gasoline consumption by ships
		Aviation kerosene consumption
		Alcohol consumption – company’s own fleet
		Diesel consumption – company’s own fleet
		Gasoline consumption – company’s own fleet
		VNG consumption – company’s own fleet
	Fugitive emissions	Use of insulating gases – leak of SF ₆
		CO ₂ consumption by fire extinguishers
		Leak of natural gas in distribution
	Land-use change	Limestone consumption
Vegetation removal		
Fertilizer denitrification		
Scope 2	Purchased electricity	Losses in the T&D system
		Electricity consumption
Scope 3	Cat 1. Purchased goods and services	LPG consumption by forklift trucks
	Cat 4. Upstream transport and distribution	Diesel consumption by outsourced trucks (light, medium and heavy trucks)
	Cat 5. Waste generated in operations	Mass of waste sent to landfills
		Mass of waste sent for incineration
		Mass of waste sent for co-processing
	Cat 6. Business travel	Air travels
	Cat 7. Employee commuting	Fuel consumption for employee commuting
	Cat 9. Downstream transport and distribution	Alcohol consumption by contractors
		Diesel consumption by contractors
Gasoline consumption by contractors		
VNG consumption by contractors		
Cat 11. Use of sold goods and services	Commercialization of electricity and natural gas	

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

The removal sources accounted for in the inventory are due to reforestation (Scope 1 – Land-use change), which was made in 2020 by means of tree planting in Cerrado and Atlantic Forest, by both CEMIG GT and CEMIG D.

As observed in Table 7, the processes defined in CLIMAS for the CEMIG inventory share a correlation with the categories established by the Brazil GHG Protocol Program⁴ (PBGHGP). PBGHGP categories are shown in Appendix E – Categories in the Brazil GHG Protocol Program.

2.5 Data collection

The information used to compile the inventory was obtained through the following sequence of events:

1. Corporate managers identified the staff members responsible for managing the information needed for the GHG Emissions Inventory;
2. Staff members that monitor the operations assessed the best possible way to obtain data from the company's management systems (existing records in the CEMIG's ERP system, records in operational and control systems, invoices, or contracts);
3. The collected information was consolidated by focal points and ultimately sent to WayCarbon.

WayCarbon developed specific spreadsheets for data collection at each focal point. CEMIG's focal points collected data throughout the year and reported the consolidated data to WayCarbon. The technical team at WayCarbon then performed a critical analysis of the data, compiled them and entered the operational data in the CLIMAS system.

⁴ Category definitions were obtained from documents published by FGV EAESP: "Nota Técnica: Classificação das emissões de gases de efeito estufa (GEE) de Escopo 1 nas respectivas categorias de fontes de emissão – versão 1.0" (available at: <http://mediadrawer.gvces.com.br/ghg/original/ghg-protocol_notatecnica_categorias-escopo-1_v1.pdf>) and "Categorias de Emissões de Escopo 3 Adotadas pelo Programa Brasileiro GHG Protocol" (available at: <http://mediadrawer.gvces.com.br/ghg/original/ghg_categorias_e3_definicoes_curta.pdf>).

2.6 Calculation of emissions

The CEMIG GHG Emissions Inventory was elaborated using CLIMAS, a calculation software developed by WayCarbon whose database has the most up-to-date emission factors available for each source type (e.g., Brazil GHG Protocol Program, for Brazil; and, when unavailable, internationally accepted references, such as the GHG Protocol, IPCC, EPA, and DEFRA⁵).

Generically, GHG emissions and removals were calculated individually for each source and sink, according to the following equation:

$$E_{i,g,y} = DA_{i,y} \cdot EF_{i,g,y} \cdot GWP_g$$

Where:

- ***i*** index that denotes the activity of an individual source or sink;
- ***g*** index that denotes a GHG type;
- ***y*** reference year of the report;
- ***E_{i,g,y}*** emissions or removals of the GHG *g* that are attributable to the source or sink *i* during the year *y*, in tCO₂e;
- ***DA_{i,y}*** consolidated data on a given activity, relative to the source or sink *i* during the year *y*, in the unit *u*. As previously stated, the consolidated data on a given activity consists of all attributes recorded from each source/sink.
- ***EF_{i,g,y}*** emission factor of the GHG *g* applicable to the source or sink *i* in the year *y*, in t GHG *g*/*u*;
- ***GWP_g*** global warming potential of the GHG *g*, in tCO₂e/tGHG *g*.

The choice of the appropriate calculation method was made based on the availability of specific data and emission factors, combustion technologies used in the process, physical and chemical properties of materials, and operational performance data.

The technical team at WayCarbon is responsible for periodically updating CLIMAS with emission factors according to internationally established methods in order to compile GHG Emissions Inventories. Emission factors were based mainly on the following references (Table 8):

⁵ IPCC: Inter Intergovernmental Panel on Climate Change; EPA: Environmental Protection Agency; DEFRA: Department for Environment, Food and Rural Affairs.

Table 8. References for emission factors

The calculation methods and specific equations used for each type of emission in the CEMIG 2020 GHG Emissions Inventory are shown in detail in Appendix B – Calculation of Emissions and Uncertainties.

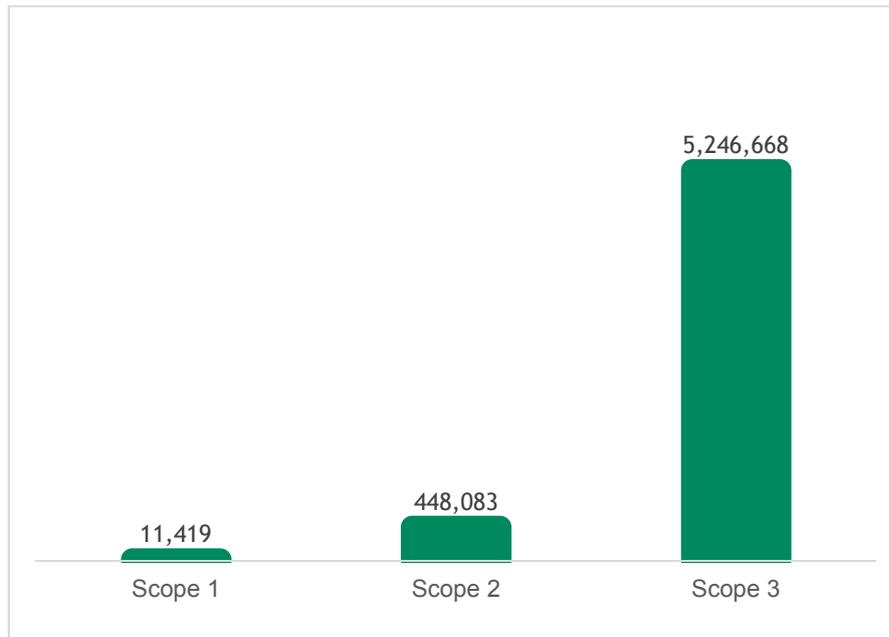

The emission factors used in the inventory as well as the calculation log⁶ are available in the CLIMAS system as Excel® spreadsheets and also in Appendix C – Emission Factors.

⁶ The calculation log and emission factors of the inventory can be accessed via CLIMAS, through the following steps: a) access CLIMAS; b) click “Emissões de GEE” [‘GHG emissions’] on the upper left-hand corner of the screen; c) click “Auditoria – Extrato de Fatores de Emissão” [‘Audit – Statement of Emission Factors’]; d) choose the 2020 inventory and click “Obter Extrato” [‘Obtain Statement’]; e) in the last table, “Fatores de emissão” [‘Emission Factors’], search for the emission source you wish to check using the search field and click the “Ver” [‘See’] button on the right-hand side of the screen; f) click the button in the field “Memorial de cálculo” [‘Calculation log’].

3. RESULTS

CEMIG's Scope 1, 2 and 3 emissions⁷ in 2020 were 11,419 tCO₂e, 448,083 tCO₂e and 5,246,668 tCO₂e, respectively. Furthermore, 5,246 tons of CO₂ of renewable⁸ origin were emitted (1,374 t of renewable CO₂ for Scope 1 and 3,891 t of renewable CO₂ for Scope 3). The company's Scope 1, 2 and 3 emissions in 2020 are shown in Figure 3:

Figure 3. GHG emissions in 2020 by scope (tCO₂e)

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Table 9 shows CEMIG's GHG emissions by scope and category. In Scope 1, the category with highest representativeness was Mobile Combustion, which accounted for 69.42% of the total emissions in the scope (7,927.83 tCO₂e). Scope 2 emissions were represented mostly by Losses in T&D (445,697.54 tCO₂e), which contributed with 99.47% of emissions in that scope. As for Scope 3 emissions, the category Use of Sold Goods and Services represented 99.56% of the total GHG emissions (5,223,549.59 tCO₂e).

⁷ GHG emissions regulated by the Kyoto Protocol (carbon dioxide – CO₂, methane – CH₄, nitrous oxide – N₂O, sulfur hexafluoride – SF₆, hydrofluorocarbons – HFCs and perfluorocarbons – PFCs).

⁸ CO₂ emissions resulting from the energetic use of biomass from renewable sources. In this study, the adopted definition of renewable biomass was the one elaborated by the Executive Board of the Clean Development Mechanism of the United Nations Framework Convention on Climate Change (EB 23, Appendix 18). This type of emission does not contribute to a long-term increase in CO₂ concentrations in the atmosphere.

Table 9. GHG emissions by scope and category (tCO₂e)

Scope	Category	Emissions (tCO ₂ e)	Representativeness (%)
Scope 1	Stationary combustion	198.43	1.74%
	Mobile combustion	7,927.83	69.42%
	Fugitive emissions	3,262.22	28.57%
	Land-use change	30.88	0.27%
	Total Scope 1 emissions	11,419.36	-
Scope 2	Electricity consumption	2,385.87	0.53%
	Losses in T&D	445,697.54	99.47%
	Total Scope 2 emissions	448,083.41	-
Scope 3	Purchased goods and services	43.45	0.00%
	Employee commuting	173.95	0.00%
	Waste generated in operations	1,004.05	0.02%
	Downstream transport and distribution	20,989.83	0.40%
	Upstream transport and distribution	808.04	0.02%
	Use of sold goods and services	5,223,549.59	99.56%
	Business travel	98.83	0.00%
	Total Scope 3 emissions	5,246,667.72	-

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Emissions by scope, operating unit and representativeness are shown in Table 10. CEMIG D was the highest emitter of Scope 1 emissions, with 79.01% of representativeness in that Scope. Scope 1 emissions from CEMIG D were mostly associated with the use of fuel by the company's own fleet (6,615.81 tCO₂e of emissions thereat).

Scope 2 emissions from CEMIG D were dominant in relation to those from the other operating units, representing 97.26% of all emissions in the scope. Scope 2 emissions were mainly associated with Losses in T&D (both technical and non-technical losses).

CEMIG D, CEMIG GT and GASMIG showed similar contributions to Scope 3 emissions: 29.21%, 34.71% and 36.08%, respectively. Scope 3 emissions were mainly associated with commercialization of electricity and natural gas. Scope 3 emissions from Centroeste in 2020 were not calculated, since this is the first year that the company's emissions are accounted for in Cemig's GHG Emissions Inventory.

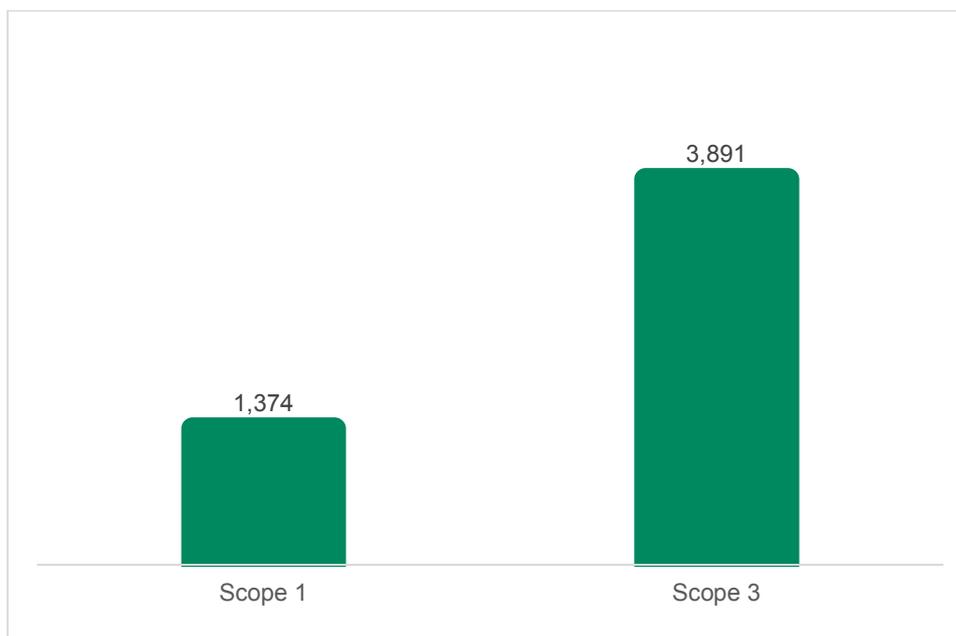

Table 10. Emissions by scope and operating unit in 2020 (tCO₂e)

Operating unit	Scope 1 (tCO ₂ e)	Contribution to Scope 1 (%)	Scope 2 (tCO ₂ e)	Contribution to Scope 2 (%)	Scope 3 (tCO ₂ e)	Contribution to Scope 3 (%)
CEMIG D	9,022.49	79.01%	435,805.59	97.26%	1,532,598.56	29.21%
CEMIG GT	2,008.20	17.59%	11,620.99	2.59%	1,821,184.80	34.71%
CEMIG SIM	1.19	0.01%	0.00	0.00%	1.24	0.00%
GASMIG	360.77	3.16%	20.27	0.00%	1,892,883.13	36.08%
CENTROESTE	26.71	0.23%	636.56	0.14%	0.00	

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

The CO₂ emitted in the burning of renewable fuels such as ethanol or biodiesel is one that has been biologically sequestered (meaning that at any moment of its lifecycle, that CO₂ was assimilated by biomass). Emissions of this gas totaled 1,374 tons of renewable CO₂ and 3,891 tons of renewable CO₂ for Scopes 1 and 3 respectively, as shown in Figure 4.

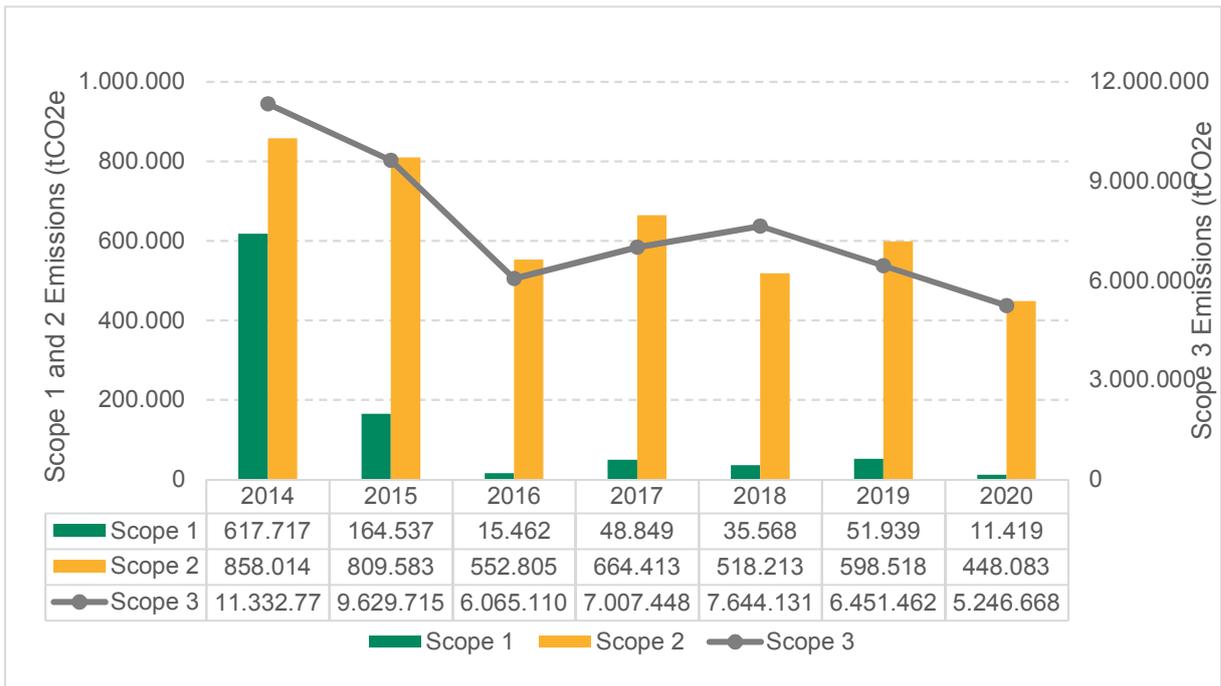

Figure 4. Renewable CO₂ emissions by scope (tons of renewable CO₂)

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

While CEMIG has recorded its emissions since 2008, the year 2014 was the one that showed the worst scenario of emissions in the company's records. Therefore, the historical series presented in this report starts in 2014. Scope 1, 2 and 3 emissions from 2014 through 2020 are shown in Figure 5.

Figure 5. Historical data series of CEMIG's emissions (tCO₂e)

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

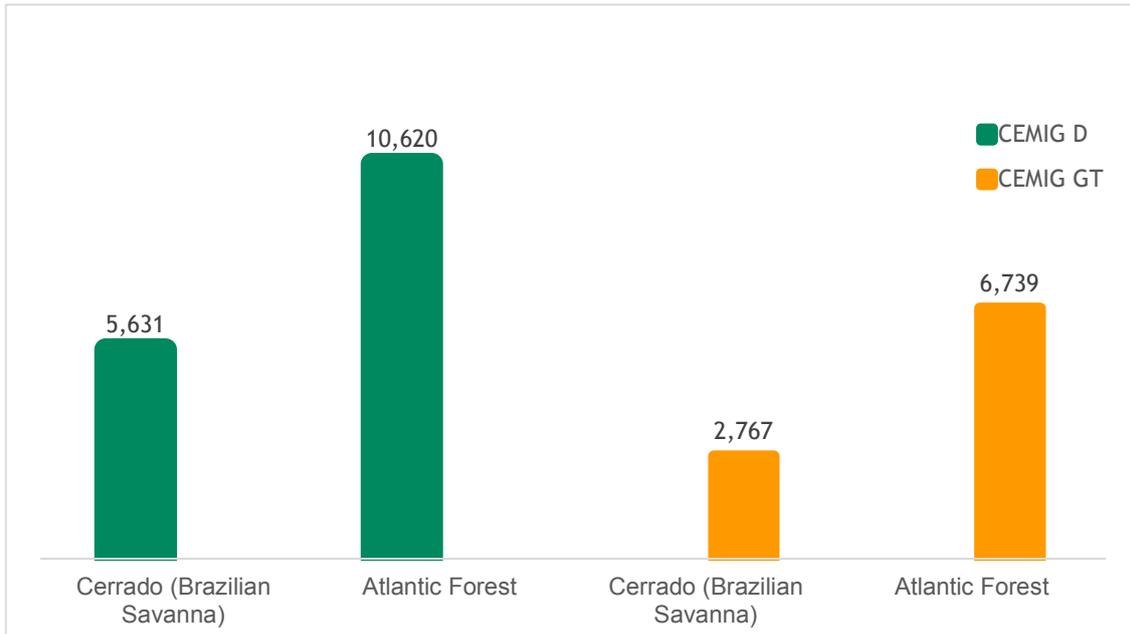

In 2020, Scope 1, 2 and 3 emissions were reduced by 98.15%, 47.78% and 53.70% respectively in relation to 2014. Compared to the previous year (2019), Scope 1, 2 and 3 emissions decreased by 78.01%, 25.13% and 18.67%, respectively.

The decrease in Scope 1 emissions was mainly associated with the decommissioning of Igarapé TPP (which was responsible for the emission of approximately 37,000 tCO₂e in the previous year) in late 2019. The variation in Scope 2 emissions was directly related to the decreased Losses in T&D (approximately a 150,000-tCO₂e decrease). On the other hand, the variation in Scope 3 emissions was due to the decrease in Use of Sold Goods and Services (commercialization of electricity and natural gas; approximately a 1,200,000-tCO₂e reduction).

Emissions from each emission source in the inventory are shown in Appendix D – Emissions by emission source.

In regard to removals, in 2020 CEMIG accounted for a total 25,756.76 tCO₂ sequestered by tree plantations in Cerrado (Brazilian savanna) and Atlantic Forest areas. CEMIG D was responsible for the removal of 16,250.71 tCO₂ (63% of removals) from the atmosphere and CEMIG GT of 9,506.06 tCO₂ (37%), as shown in the figure below.

Figure 6. Removals due to tree planting by CEMIG (tCO₂)

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

3.1 SCOPE 1

CEMIG's Scope 1 emissions in 2020 totaled 11,419.36 tCO₂e, showing a 78.01% decrease in relation to the previous year (2019 = 51,939 tCO₂e) and a 98.15% decrease in relation to 2014 (617,717 tCO₂e).

Scope 1 emissions by category and representativeness are shown in Table 11:

Table 11. Scope 1 emissions by category (tCO₂e)

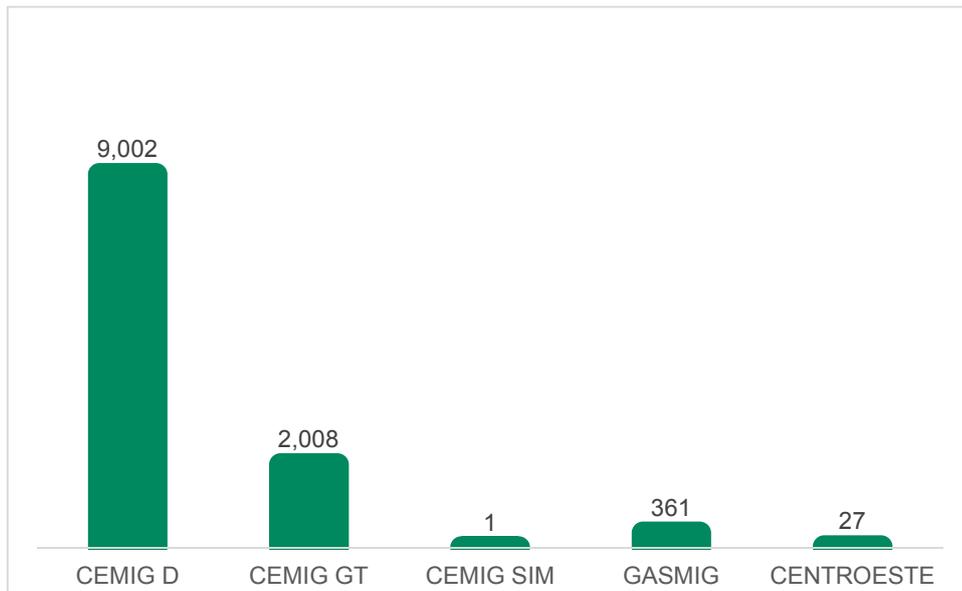

Scope	Category	Emissions (tCO ₂ e)	Representativeness (%)
Scope 1	Stationary combustion	198.43	1.74%
	Mobile combustion	7,927.83	69.42%
	Fugitive emissions	3,262.22	28.57%
	Land-use change	30.88	0.27%
	Total Scope 1 emissions	11,419.36	-

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Mobile Combustion was the category that contributed the most to Scope 1 emissions, with 7,927.83 tCO₂e, which represented a 12.57% reduction in relation to 2019. Within this category, diesel consumption by the company's own fleet accounted for the emission of 6,649.73 tCO₂e. As for Stationary Combustion, emissions totaled 198.43 tCO₂e, which corresponds to a decrease of approximately 37 thousand tCO₂e in relation to 2019. Such decrease is due to the decommissioning of Igarapé TPP, which was previously the major responsible for CEMIG's Scope 1 emissions.

Fugitive emissions totaled 3,262.22 tCO₂e, having derived mainly from the leak of SF₆ (2,953.51 tCO₂e). Emissions from this category a 40.44% reduction in relation to 2019, due not only to best practices but also to the corporate procedure for SF₆ emissions management which was implemented in 2020. Land-use change, on the other hand, showed the lowest representativeness among Scope 1 categories, with 30.88 tCO₂e. The chart below shows CEMIG's GHG emissions in 2020 by operating unit (Figure 7):

Figure 7. Scope 1 emissions by operating unit (tCO₂e)

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Scope 1 emissions mainly derived from CEMIG D (79.01% of emissions), mostly due to diesel consumption by the company's own fleet and to the leak of SF₆. CEMIG GT ranked second in Scope 1 emissions (17.59%), with the same main precursors (diesel and SF₆).

Emissions by precursor are shown in Table 12. The data reveals that diesel (59.85%) and SF₆ (25.86%) were the main precursors of CEMIG's Scope 1 emissions.

Table 12. Scope 1 emissions by precursor (tCO₂e)

Precursor	Emissions (tCO ₂ e)	Representativeness (%)
Dolomitic limestone	1.44	0.01%
CH ₄	302.27	2.65%
CO ₂	6.44	0.06%
Diesel / Brazil	6,834.52	59.85%
Hydrous ethanol	3.26	0.03%
Liquefied petroleum gas (LPG)	1.35	0.01%
Natural gas	13.64	0.12%
Vehicular natural gas (VNG)	53.46	0.47%
Gasoline / Brazil	1,022.38	8.95%
Nitrogen in fertilizers	2.73	0.02%
Aviation kerosene	197.64	1.73%
SF ₆	2,953.51	25.86%
Native vegetation	26.71	0.23%
Total Scope 1 emissions	11,419.36	-

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Table 13 shows the Scope 1 emissions from all Generation units inventoried in 2020. The units Camargos, Itutinga, Leste, Oeste, Salto Grande and Três Marias emitted GHGs resulting from Stationary Combustion (diesel consumption by generators) and Mobile Combustion (fuel consumption by fleet). In addition, Rosal also showed emissions from Land-Use Change (limestone and fertilizer denitrification). Emissions at CEMIG PCH, Sul, Sá Carvalho, Parajuru and Volta do Rio derived solely from Mobile Combustion, whereas emissions from Horizontes derived solely from Stationary Combustion. CEMIG GT alone accounted for 91.61% of all Scope 1 emissions.

Table 13. Scope 1 emissions by operating unit (tCO₂e)

Operating unit	Emissions (tCO ₂ e)	Representativeness (%)
CEMIG GT	1,839.62	91.61%
Camargos	11.22	0.56%
CEMIG PCH	0.04	0.00%
Horizontes	0.14	0.01%
Itutinga	13.05	0.65%
Leste	12.51	0.62%
Oeste	12.15	0.61%
Parajuru - wind farm	18.01	0.90%
Rosal	7.04	0.35%
Sá Carvalho	1.37	0.07%
Salto Grande	9.21	0.46%
Sul	16.59	0.83%
Três Marias	11.97	0.60%
Volta do Rio - wind farm	55.29	2.75%
Total - CEMIG's Generation units	2,008.20	

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

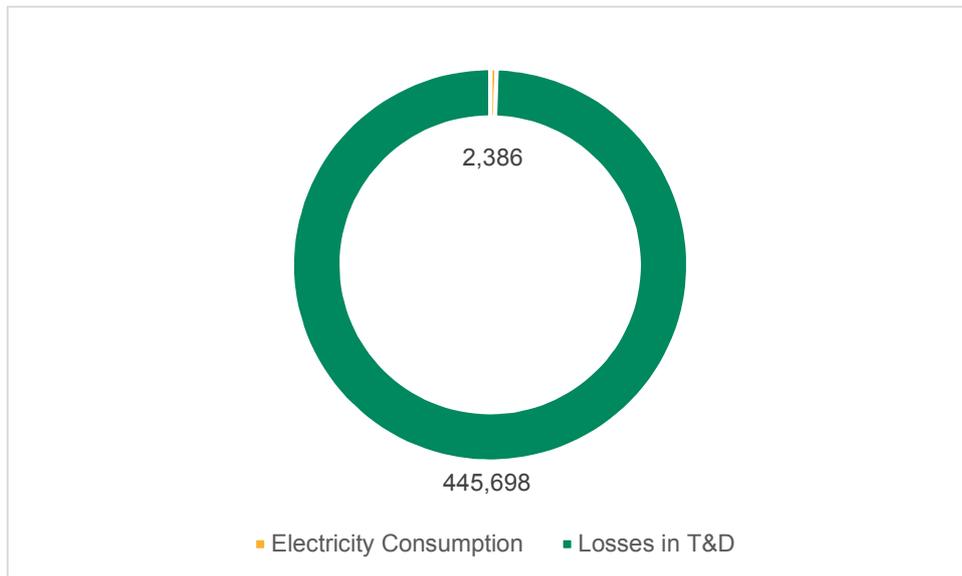

Aside from CEMIG GT, the wind farms Volta do Rio and Parajuru were the units that showed highest emissions (55.29 tCO₂e and 18.01 tCO₂e, respectively), followed by Sul (16.59 tCO₂e). Emissions by those three units derived mainly from Mobile Combustion.

3.2 SCOPE 2

CEMIG's Scope 2 emissions in 2020 totaled 448,083.41 tCO₂e, representing a 25.13% decrease in relation to the previous year (598,518 tCO₂e in 2019) and a 47.78% reduction in relation to 2014 (858,014 tCO₂e).

Emissions from Losses in Transmission and Distribution (which represented 99.47% of Scope 2 emissions) decreased by approximately 25.14% in 2020 in relation to the previous year, due mostly to a 17.73% reduction in the grid mean emission factor (0.0750 tCO₂e/MWh in 2019 against 0.0617 tCO₂e/MWh in 2020). Emissions resulting from Losses in T&D and from Electricity Consumption are shown in Figure 8.

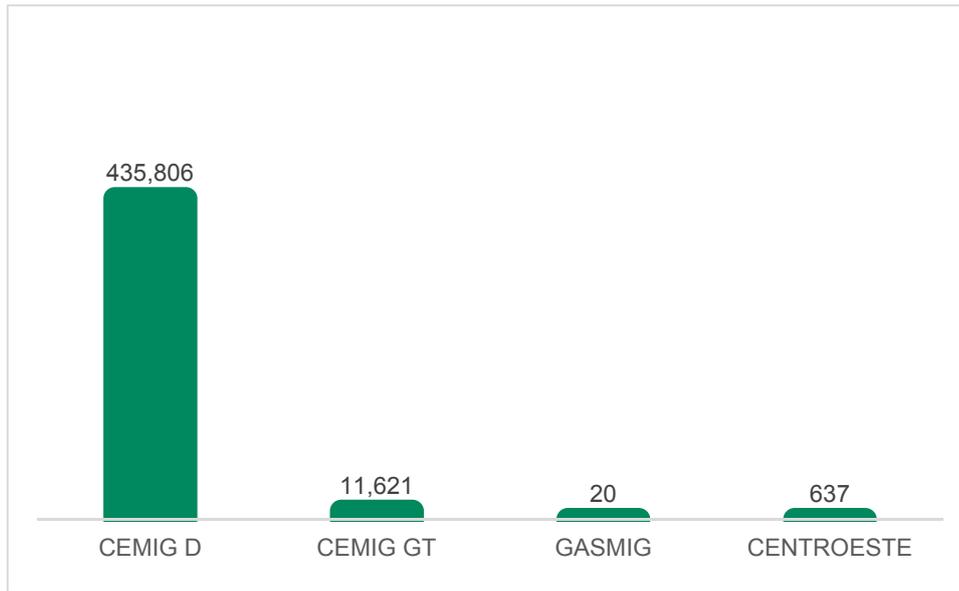

Figure 8. Scope 2 emissions by emission source (tCO₂e)

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Scope 2 emissions by operating unit are shown in Figure 9. As a power distribution company, CEMIG D shows significantly higher emissions than other units (97.26% of the total Scope 2 emissions). Emissions by CEMIG GT represented 2.59% of total Scope 2 emissions, followed by CENTROESTE, with 0.14% of representativeness.

Figure 9. Scope 2 emissions by operating unit (tCO₂e)

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

3.3 SCOPE 3

CEMIG's Scope 3 emissions in 2020 totaled 5,246,668 tCO₂e, representing an 18.67% reduction in relation to the previous year (6,451,462 tCO₂e in 2019) and a 53.70% reduction in relation to 2014 (11,332,770 tCO₂e). Table 14 shows the company's GHG emissions by category and source over the last 7 years:

Table 14. Scope 3 emissions by category over the last 7 years (tCO₂e)

Category	2014	2015	2016	2017	2018	2019	2020	Representativeness (%)
Employee commuting	586	600	591	494	112	215	174	0.00%
Waste generated in operations	-	-	-	-	338	616	1,004	0.02%
Downstream transport and distribution	5,729	12,851	13,241	19,871	13,700	22,699	20,990	0.40%
Upstream transport and distribution	817	373	548	575	673	791	808	0.02%
Use of sold goods and services	11,324,277	9,614,752	6,049,885	6,985,687	7,628,548	6,426,649	5,223,550	99.56%
Business travel	1,361	1,138	846	822	689	428	99	0.00%
Purchased goods and services	-	-	-	-	71	63	43	0.00%
Grand total	11,332,770	9,629,714	6,065,111	7,007,449	7,644,131	6,451,462	5,246,668	-

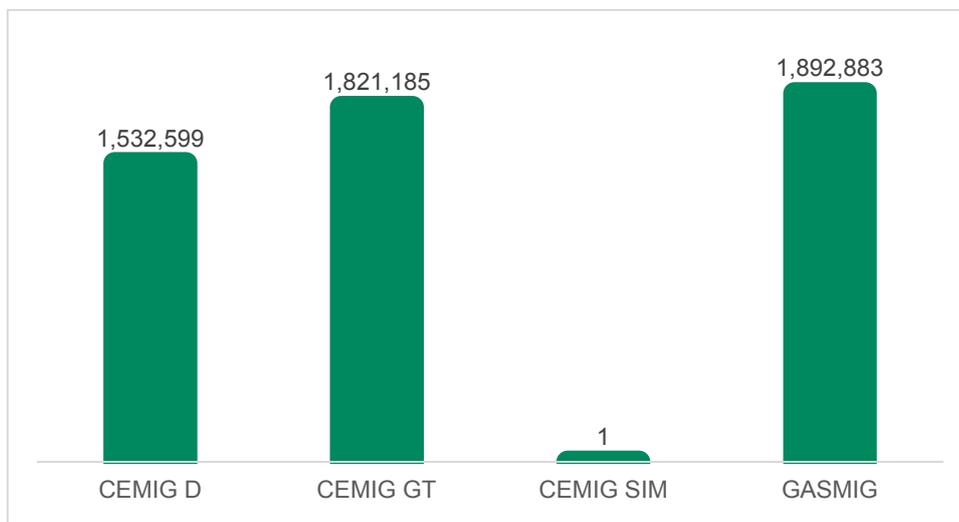

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Scope 3 emissions were mainly associated with the commercialization of electricity and natural gas, which is categorized under Use of Sold Goods and Services. Emissions from this category represented almost the entirety of Scope 3 emissions (99.56% of the total).

The category Downstream Transport and Distribution accounts for emissions resulting from fuel consumption (alcohol, gasoline, diesel and VNG) by contractors hired by CEMIG D. For the 2020 Inventory, 17 contractors (100% of current contracts) provided this data voluntarily. Even with an increased number of contractors that reported their data, emissions from that category showed a 7.53% reduction, due mostly to a decreased use of fuels and increased use of ethanol proportionately to gasoline.

The units CEMIG D, CEMIG GT and GASMIG accounted for 29.21%, 34.71% and 36.08% of Scope 3 emissions, respectively. On the other hand, emissions from CEMIG SIM were irrelevant compared with those from the other units. Scope 3 emissions from Centroeste in 2020 were not calculated, since this is the first year that the company's emissions are accounted for in Cemig's GHG Emissions Inventory. Figure 10 shows the Scope 3 emissions by operating unit.

Figure 10. Scope 3 emissions by operating unit (tCO₂e)

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Table 15 shows the precursors responsible for CEMIG's Scope 3 emissions. The data reveals that electricity (63.48%), natural gas (34.90%) and vehicular natural gas (1.17%) were the main precursors of Scope 3 emissions.

Table 15. Scope 3 emissions by precursor (tCO₂e)

Precursor	Emissions (tCO ₂ e)	Representativeness (%)
Diesel / Brazil	20,648.51	0.39%
Electricity / Brazil	3,330,674.54	63.48%
Hydrous ethanol	11.29	0.00%
Liquefied petroleum gas (LPG)	43.45	0.00%
Natural gas	1,831,338.91	34.90%
Vehicular natural gas (VNG)	61,537.36	1.17%
Gasoline / Brazil	1,310.78	0.02%
Aviation kerosene	98.83	0.00%
Industrial waste / Solvents, plastics and other petroleum products	623.46	0.01%
Urban solid waste / Waste from gardens and parks	378.42	0.01%
Industrial waste / Construction and demolition	2.16	0.00%
Total Scope 3 emissions	5,246,667.72	

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Table 16 shows the Scope 3 emissions from the Generation units inventoried in 2020. All units (Camargos, CEMIG PCH, Horizontes, Itutinga, Leste, Oeste, Parajuru, Rosal, Sá Carvalho, Salto Grande, Sul, Três Marias, and Volta do Rio) produced emissions from the category Use of Sold Goods and Services (commercialization of electricity).

Table 16. Scope 3 emissions by operating unit (tCO₂e)

Operating unit	Emissions (tCO ₂ e)	Representativeness (%)
CEMIG GT	1,686,454	92.60%
Camargos	2,642	0.15%
CEMIG PCH	8,090	0.44%
Horizontes	5,327	0.29%
Itutinga	4,710	0.26%
Leste	2,118	0.12%
Oeste	1,482	0.08%
Parajuru - wind farm	4,538	0.25%
Rosal	14,991	0.82%
Sá Carvalho	29,512	1.62%
Salto Grande	14,124	0.78%
Sul	4,794	0.26%
Três Marias	37,232	2.04%
Volta do Rio - wind farm	5,172	0.28%
Total - CEMIG's Generation units	1,821,185	-

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

Emissions at CEMIG GT represented 92.60% of all Scope 3 emissions, since this unit also produced emissions from other categories. Aside from CEMIG GT, the operating units Três Marias, Sá Carvalho

and Rosal were the ones that showed highest emissions, with representativeness values of 2.04%, 1.62% and 0.82%, respectively.

A novel component of the CEMIG's 2020 GHG Emissions Inventory was the incorporation of Renewable Energy Certificates (RECs) to account for part of the commercialized electricity. RECs aim to attest that a given amount of electricity was generated from renewable sources (hydroelectric, photovoltaic, biomass, wind power, etc.), enabling the accounting and tracking of the guaranteed power performance. For control purposes, a given REC that has already been sold cannot be commercialized again. All certificates are given a unique identification number and include data attributes such as: renewable fuel type, renewable facility location, date of generation, amount of energy commercialized, utility to which the project is interconnected, etc. Each REC is equivalent to 1 MWh.

Since 100% of the electricity generated by CEMIG originated from renewable sources, in 2020 two types of RECs were issued: I-REC, from Emborcação Hydroelectric Power Plant (HPP) - following the I-REC Standard - and Cemig-REC (a CEMIG internal initiative), from Nova Ponte HPP. Overall, a total 4,132 RECs were sold and retired for Mater Dei Betim, 10,647 for Mater Dei Contorno, 6,189 for Mater Dei Santo Agostinho, 112,972 for Verallia, and 22,001 for Novo Nordisk. Since Cemig's RECs originate from hydroelectric power, their emission factor is zero.

That being said, in the category Use of Sold Goods and Services we considered the total amount of electricity commercialized by CEMIG GT minus the total number of RECs sold in 2020 (155,942 RECs or MWh), with an Emission Factor of zero. For the remaining amount of electricity commercialized by CEMIG GT, we adopted the Brazilian National Interconnected System (SIN) EF for each month.

4. UNCERTAINTY ANALYSIS

Compiling an emissions inventory requires using several calculation tools that are based on predictions, parameters and standard emission factors. The use of these tools may lead to a certain degree of uncertainty in the inventory's calculations.

To minimize such uncertainties, values based on official sources such as the consulted methods or market standards were used whenever possible, always taking into consideration the principles of conservative calculation, accuracy, and transparency.

Moreover, all sources of the parameters used were filed for ulterior analysis and checking by an external organization. This section presents a qualitative evaluation of the major uncertainties identified, as well as a quantitative assessment of the uncertainty in the calculation of emissions from each of the company's operating units.

The uncertainties associated with the inventory can be classified in two groups:

- **scientific uncertainty:** the uncertainty that arises when the science of the actual emission and/or removal process is not fully understood. E.g., the significant involvement of scientific uncertainty in the use of direct and indirect factors associated with global warming to estimate the emissions of several GHGs. Most factors used in this study were obtained from the IPCC.
- **estimation uncertainty:** the uncertainty that arises any time GHG emissions are quantified. Estimation uncertainty can be further classified in model uncertainty, when it is associated with the mathematical equations used to characterize the relationships between various parameters and emission processes; and parameter uncertainty, which is that associated with parameters introduced as inputs in estimation models.

According to recommendations in the IPCC Good Practice Guidance, inventories must not disclose emissions having any bias that could be identified and eliminated, and uncertainties must be minimized considering all the existing scientific knowledge and available resources.

These recommendations were followed throughout all stages of inventorying. In that sense, we cared to use the most recent calculation methods and emission factors provided by organizations of high credibility in the field of emissions calculation. Regarding the data used, special attention was paid to their conformity to reality (checking of the company's records and analysis of the data received) and a careful search was conducted for data in the units of measurement that would reduce the uncertainties associated with emissions.

The procedures adopted to calculate uncertainties are shown in Appendix B – Calculation of Emissions and Uncertainties. For CEMIG’s 2020 GHG Emissions Inventory, the uncertainties were also calculated using CLIMAS. The results are shown in Table 17, where:

- **lower uncertainty** = lower limit of the 95% confidence interval, in %; and
- **upper uncertainty** = upper limit of the 95% confidence interval, in %.

Table 17. Results of uncertainties from the 2020 inventory

Category	Lower uncertainty	Upper uncertainty
Purchased electricity	0.00%	0.00%
Purchased goods and services	1.69%	3.23%
Stationary combustion	0.91%	0.33%
Mobile combustion	0.69%	0.59%
Employee commuting	0.66%	0.59%
Fugitive emissions	0.00%	0.00%
Land-use change	39.43%	14.80%
Losses in T&D	0.00%	0.00%
Waste generated in operations	2.49%	2.35%
Downstream transport and distribution	0.99%	0.79%
Upstream transport and distribution	1.07%	0.85%
Use of sold goods and services	0.47%	0.71%
Business travel	0.00%	0.00%
Total	0.43%	0.65%

Source: Elaborated by the WayCarbon team based on data from the CLIMAS software.

5. CORPORATE TARGETS

CEMIG is committed to mitigating emissions of gases that contribute to Climate Change, and thereby in 2018 the company set two targets for tCO₂e emissions. The first one consists in an absolute target based on the combined emissions from scopes 1 and 2, while the second is an intensity target for scope 2 emissions, based on emissions from total Losses in Electricity Transmission and Distribution.

2022 was set as target year whereas 2017 was established as base year for total emissions. For scope 1 emissions, we adopted the following criteria: keeping the percentage of SF₆ emissions at a maximum 0.66% (SF₆ emissions (kg)/total installed stock (kg)); and reducing emissions from mobile sources by 10% in relation to 2017. For scope 2 emissions, we adopted the following criteria: keeping electricity consumption at a maximum 156,773 GJ (2017 value); and reach 12.56% total losses in 2020 and 11.53% in 2021 and 11.24% in 2022.

The absolute target based on combined emissions from scopes 1 and 2 has been met: we achieved a value 4.85% below the set target for 2020, having reduced in 29% the scope 1 and 2 emissions in relation to 2019. The scope 2 emissions target was also met: we achieved a value 0,07% below the set target for 2020, having reduced emissions from this scope by 25.13% in relation to 2019. The relative target for percent total losses has been revised, due to changes that have been implemented in 2020 by ANEEL (Brazilian Electricity Regulatory Agency) concerning the calculation of losses.

6. RECOMMENDATIONS

In order for companies to adapt to a low-carbon economy, a virtuous cycle of analysis and process improvement must be developed. When carefully detailed and organized, such set of activities integrates the corporate plan for managing GHG emissions.

The pathway begins with a diagnosis of the current situation, by gathering technical knowledge on the subject of Climate Change mitigation and its application to the company. Once the company's impacts on Climate Change as well as their risks and opportunities to the business have been mapped, it is possible to evaluate process alternatives and select projects that reduce carbon intensity (GHG emissions by production). Then, a process must be structured to continuously follow up the company's climate performance, in order to assess the impact of the implemented projects and, based on the obtained results, update the diagnosis.

The GHG Emissions Inventory is the first step of the diagnosis and it must be continuously improved.

The improvement strategies recommended to CEMIG are:

- expand the monitored emission sources, by calculating the emissions from other Scope 3 categories such as wastewater treatment;
- implement a monthly information flow and follow up the impact on Climate Change on a monthly-basis as a form of environmental management;
- manage primary evidence, following it up either through a system or via SharePoint.

Besides the inventory, there are other types of studies aimed to diagnose the company's situation in the context of a low-carbon economy, such as:

- calculation of impact indicators per product or service provided, thereby enabling the comparison with companies of diverse sizes and the evaluation of climate management efficiency;
- identification of risks and opportunities in regulatory scenarios, e.g., with mechanisms of carbon pricing.

The next steps are to plan and act on the Climate Change issue. That includes:

- sector benchmarking;
- defining a mitigation strategy;
- defining an adaptation strategy;
- defining a neutralization strategy.

GLOSSARY

Base year: a specific historical period to compare GHG emissions and removals, as well as other related information.

Carbon dioxide equivalent (CO₂e): the unit used to compare the radiative forcing impact (global warming potential) of a given GHG with that of CO₂.

Direct GHG emissions: GHG emissions by sources belonging to or controlled by the company. To establish the company's operational boundaries, the concepts of financial control and operational control may be adopted.

Emission factor or GHG removal factor: a factor that correlates activity data with GHG emissions and removals.

GHG emissions: the total mass of a GHG released to the atmosphere during a specific period.

GHG emissions inventory: a document which provides detailed information concerning the GHG sources and sinks and quantitative data regarding GHG emissions and removals during a given period.

GHG removals: the total mass of a given GHG removed from the atmosphere in a specific period.

GHG reservoir: any physical unit or component of the biosphere, geosphere or hydrosphere that is capable of storing or accumulating GHG removed from the atmosphere by a sink or GHG captured from a source. The total carbon mass contained in a GHG reservoir in a specific period can be referred to as the reservoir's carbon stock. A GHG reservoir may transfer its gases to another GHG reservoir. The capture of GHG from a source before the gases enter the atmosphere and their storage in a reservoir can be referred to as GHG capture and storage.

GHG sink: any physical unit or process that removes GHG from the atmosphere.

GHG source: any physical unit or process that releases GHG to the atmosphere.

Global warming potential (GWP): a factor that describes the radiative forcing impact of a mass unit of a given GHG, in relation to a mass unit of carbon dioxide (CO₂) in a given period.

Greenhouse gas (GHG): an atmospheric constituent, of either natural or anthropogenic origin, that absorbs and emits radiation in specific wavelengths within the spectrum of infrared radiation emitted by the Earth's surface, by the atmosphere and by clouds. E.g.: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFC), perfluorocarbons (PFC) and sulfur hexafluoride (SF₆).

Indirect GHG emissions related to energy consumption: GHG emissions from generation of electricity, heat or steam, either imported or consumed by the company.

Offset: credits to compensate for GHG emissions.

Organization: any company, corporation, enterprise, authority or institution – either a part or combination of –, incorporated or not, public or private, that has its own functions and administration.

Other indirect GHG emissions: indirect GHG emissions other than the indirect emissions related to energy consumption. These emissions result from the company's activities, but do not originate from sources owned or controlled by other companies.

Scope: the concept of scope was introduced by the GHG Protocol aiming to aid companies in defining their operational boundaries. Scopes are differentiated in three categories, being separated in direct and indirect emissions.

Scope 1: encompasses the category of direct GHG emissions of the company, i.e., those originating from sources belonging to or being controlled by the company within the defined boundaries. E.g., emissions from the burning of fossil fuels and from manufacturing processes.

Scope 2: encompasses the category of indirect GHG emissions related to external energy purchase. E.g., consumption of the electricity generated by power distribution companies from the Brazilian National Interconnected System (SIN, Portuguese acronym) and purchased thermal energy.

Scope 3: encompasses the category of indirect GHG emission by other sources, i.e., emissions that occur due to activities held by the company but originating in sources that do not belong to or are not controlled by it. E.g., transport of products in vehicles not owned by the company, use of vehicles by third-parties, transport of employees and business travel.

APPENDIX A - GHG PROTOCOL TABLES

Since reporting the emissions from international operating units is optional for the GHG Protocol, such emissions were separated from those originated in Brazilian facilities. Hence, the results presented in this section differ from those presented in the main body of the report. The aim of this section is to facilitate to CEMIG the reporting of its data to the public registry of emissions.

APPENDIX B - CALCULATION OF EMISSIONS AND UNCERTAINTIES

B.1 FUEL CONSUMPTION BY MOBILE AND STATIONARY EQUIPMENT

The GHG emissions resulting from the burning of fossil fuels were calculated based on the fuel consumption, in volume, or on the distance covered, per fuel type and vehicle type, in 2020. When data is provided in terms of fuel consumption, GHG emissions from that given source are calculated according to the following equation:

$$E_{i,g,y} = C_{i,y} \cdot LHV_{i,y} \cdot EF_{i,g,y} \cdot GWP_g$$

Where:

- ***i*** index that denotes the fuel type;
- ***g*** index that denotes a GHG type;
- ***y*** reference year of the report;
- **$E_{i,g,y}$** emissions or removals of the GHG *g* that are attributable to the source *i* during the year *y*, in tCO₂e;
- **$C_{i,y}$** consumption of the fuel *i* during the year *y*, in the unit of measurement *u*, with *u* being given in m³ or kg;
- **$LHV_{i,y}$** lower heating value of the fuel *i* during the year *y*, in the unit of measurement TJ/*u*;
- **$EF_{i,g,y}$** emission factor of the GHG *g* applicable to the fuel *i* in the year *y*, in tGHG g/TJ;
- **GWP_g** global warming potential of the GHG *g*, in tCO₂e/tGHGg.

In the cases where the input data is the covered distance, emissions are calculated by the following equation:

$$E_{i,g,y} = \frac{D_{i,j,y}}{FE_{i,j,y}} \cdot LHV_{i,y} \cdot EF_{i,g,y} \cdot GWP_g$$

Where:

- ***i*** index that denotes the fuel type;
- ***j*** index that denotes the vehicle type;
- ***g*** index that denotes a GHG type;
- ***y*** reference year of the report;

- $E_{i,g,y}$ emissions or removals of the GHG g that are attributable to the source i during the year y , in tCO₂e;
- $D_{i,j,y}$ distance covered by the vehicle j that uses the fuel i during the year y , in km;
- $FE_{i,j,y}$ fuel economy of the vehicle j , in the unit of measurement u/km , with u being given in m^3 or kg ;
- $LHV_{i,y}$ lower heating value of the fuel i during the year y , in the unit of measurement TJ/u ;
- $EF_{i,g,y}$ emission factor of the GHG g applicable to the fuel i in the year y , in tGHG g/TJ ;
- GWP_g global warming potential of the GHG g , in tCO₂e/tGHG g .

The types of GHG emitted in fuel burning are CO₂, CH₄ and N₂O.

Gasoline and diesel consumption demand an additional calculation stage, since in 2020 the Brazilian law required that these fuels contained specific proportions of biofuels in their composition. For gasoline, the requirement was 27% of anhydrous ethanol. For diesel, the required proportions were 11% in January and February, 12% from March through August, 10% in September and October, and 11% in November and December, according to information retrieved from the ANP (Brazilian National Agency of Petroleum, Natural Gas and Biofuels) website and GHG Protocol tool. To calculate the emissions resulting from consumption of these fuel types, the biofuel percentages were multiplied by the total consumption of the fuel mixture prior to the use of the equation described above.

The categories in this report that were calculated using the equations above were: fuel consumption by stationary equipment, fuel consumption by mobile equipment, outsourced transport, employee commuting, and business travels (taxi, only).

B.2 ELECTRICITY CONSUMPTION

GHG emissions resulting from electricity consumption were calculated using data on the amount of electric energy consumed by operating unit, in MWh, in 2019. To calculate emissions, monthly consumption values were used due to the variation in emission factors of the Brazilian grid.

The GHG considered in the generation of electricity by the Brazilian grid is CO₂, and its emissions are calculated according to following equation:

$$E_{CO_2,m,y} = C_{m,y} \cdot EF_{CO_2,m,y}$$

Where:

- m month of electricity consumption;
- y reference year of the report;
- $E_{CO_2,m,y}$ CO₂ emissions that are attributable to the electricity consumption by the Brazilian grid in the month m of the year y , in tCO₂e;
- $C_{m,y}$ electricity consumption by the Brazilian grid in the month m of the year y , in MWh;
- $EF_{i,g,y}$ CO₂ emission factor applicable to the electricity of the Brazilian grid in the month m of the year y , in tCO₂/MWh.

The category ‘electricity consumption’ of this report was calculated by the above equation.

B.3 CONSUMPTION OF REFRIGERANT AND INSULATING GASES

GHG emissions resulting from consumption of refrigerant and insulating gases were calculated using data on the amount of gases consumed by operating unit, in kg, in 2020. The mass of consumed gases was multiplied by their respective global warming potentials so that their CO₂e could be obtained, according to the following equation:

$$E_{CO_2e,g,y} = C_{g,y} \cdot GWP_g \cdot 1000$$

Where:

- y reference year of the report;
- g index that denotes a GHG type;
- $E_{CO_2e,g,y}$ CO₂ emissions that are attributable to the consumption of the refrigerant gas g in the year y , in tCO₂e;
- C_y consumption of refrigerant gases in the year y , in kg;
- GWP_g global warming potential of the GHG g , in tCO₂e/tGHG g .

In the case of blends of refrigerant gases, emissions were calculated by multiplying the percentages of each refrigerant gas in the blend on the above equation.

The category ‘fugitive emissions’ of this report was also calculated by the above equation.

B.4 AIR TRAVEL

The first step to calculate GHG emissions from air travel is to record the distances covered by flights. The CLIMAS system has a function by which straight-line distances covered in air travels are calculated using their IATA⁹ codes (e.g., GRU/FOR in the case of a trip from Guarulhos to Fortaleza). Additionally, a correction factor of 8% is applied, following the DEFRA recommendation, in order to estimate the real distance covered in the air travels, since the distances are in reality not travelled in a straight line. After distances are calculated, air travels are then classified as short-, medium- or long-haul flights.

The GHG emissions from short-, medium- and long-haul flights are calculated according to the following equations:

$$E_{CO2e,tr,y} = Distance_{tr} \cdot pax \cdot EF_{CO2,tr,y}$$

$$E_{CH4,tr,y} = Distance_{tr} \cdot pax \cdot EF_{CH4,tr,y}$$

$$E_{N2O,tr,y} = Distance_{tr} \cdot pax \cdot EF_{N2O,tr}$$

Where:

- **y** reference year of the report;
- **tr** classification of the distance covered (short-, medium- or long-haul);
- **$E_{CO2,tr,y}$** CO₂ emissions resulting from burning of fuels by the airplane that travelled the distance of type *tr* in the year *y*, in tCO₂;
- **$E_{CH4,tr,y}$** CH₄ emissions resulting from burning of fuels by the airplane that travelled the distance of type *tr* in the year *y*, in tCH₄;
- **$E_{N2O,tr,y}$** N₂O emissions resulting from burning of fuels by the airplane that travelled the distance of type *tr* in the year *y*, in tN₂O;
- **$Distance_{tr}$** straight-line distance covered in the air travel of type *tr* corrected by a factor of 8%, in km;
- ***pax*** number of passengers that travelled the distance of type *tr*;

⁹ IATA (International Air Transport Association) is a simple identifier of codes from airports worldwide.

- $EF_{CO_2,tr}$ CO₂ emission factor applicable to the burning of fuels by the airplane that travelled the distance of type tr , in tCO₂/pax.km;
- $EF_{CH_4,tr}$ CH₄ emission factor applicable to the burning of fuels by the airplane that travelled the distance of type tr , in tCH₄/pax.km;
- $EF_{N_2O,tr}$ N₂O emission factor applicable to the burning of fuels by the airplane that travelled the distance of type tr , in tN₂O/pax.km.

The emission factors ($EF_{CO_2,tr}$, $EF_{CH_4,tr}$ and $EF_{N_2O,tr}$) have been removed from the emissions calculation tool of the 2020 Brazil GHG Protocol Program.

B.5 AGGREGATED AND OTHER NON-CO₂ EMISSIONS

The GHG emissions mapped from this source result from the use fertilizers in the soil, especially nitrogen fertilizers, limestone and urea. The input data needed to calculate these emissions is the total amount of fertilizers applied to the soil in the year, by type.

In the case of application of limestone (liming) and urea to the soil, CO₂ emissions are calculated according to the following equation:

$$E_{CO_2,i,y} = F_{i,y} \cdot FC_i \cdot \frac{44}{12}$$

Where:

- y reference year of the report (2020);
- i application of the fertilizer i (dolomitic limestone or urea);
- $E_{CO_2,i,y}$ CO₂ emissions that are attributable to application of the fertilizer i in the year y , in t CO₂;
- $F_{i,y}$ amount of the fertilizer i used in the year y , in t;
- FC_i amount of C present in the molecular formula of the fertilizer i , in t C/t.

The compound considered to calculate emissions resulting from use of agricultural limestone was dolomitic limestone, since the information obtained from the Brazilian Association of Agricultural Limestone Producers (ABRACAL, Portuguese acronym) is not listed individually by liming type.

Besides CO₂ emission, the use of fertilizers in the soil, like urea and other nitrogen additives, also leads to emission of N₂O. Such emissions are calculated by the following equation:

$$E_{N20,i,y} = F_{i,y} \cdot (EF1_i + EF4_i \cdot \text{FracGas}F_i + EF5_i \cdot \text{FracLeach}_i) \cdot F_{N_i} \cdot \frac{44}{28}$$

Where:

- ***y*** reference year of the report (2020);
- ***i*** application of the fertilizer *i*;
- ***E_{N20,i,y}*** N₂O emissions that are attributable to application of the fertilizer *i* in the year *y*, in *t N₂O*;
- ***F_{i,y}*** amount of the fertilizer *i* used in the year *y*, in *t*;
- ***F_{N_i}*** amount of N present in the molecular formula of the fertilizer *i*, dimensionless;
- ***EF1_i*** N factor considering additions, volatilization and displacement of N from fertilizer *i*, dimensionless (default value of 0.01, according to IPCC, 2006);
- ***EF4_i*** Volatilization and re-deposition factor applicable to fertilizer *i*, dimensionless (default value of 0.01, according to IPCC, 2006);
- ***EF5_i*** Leaching/runoff factor applicable to fertilizer *i*, dimensionless (default value of 0.0075, according to IPCC, 2006);
- ***FracGasF_i*** Factor of N loss by volatilization of NH₃ and NO_x for the fertilizer type *i*, dimensionless (default value of 0.1, according to IPCC, 2006);

FracLeach_i Factor of N loss by leaching/runoff for the fertilizer type *i*, dimensionless (default value of 0.3 according to IPCC, 2006).

B.6 EMISSIONS FROM GENERATED WASTE

Co-processing GHG emissions were calculated using data on the waste produced that was sent for co-processing in 2020, in tons. Emissions are calculated using the following equation:

$$E_{CO2,i,y} = m_{i,y} \cdot CC_i \cdot \frac{44}{12} + m_{i,y} \cdot EF_{CH4,i} \cdot GWP_{CH4} + m_{i,y} \cdot EF_{N20,i} \cdot GWP_{N20}$$

Where:

- **i** waste type;
- **y** reference year of the report;
- **$E_{CO2,i,y}$** CO₂ emissions resulting from co-processing of waste i during the year y, in tCO₂e;
- **$m_{i,y}$** waste mass produced in the year y, in the unit of measurement u, with u being given in t;
- **CC_i** carbon content in waste i, dimensionless;
- **$EF_{CH4,i}$** emission factor of CH₄ resulting from co-processing of waste i, in tCH₄;
- **GWP_{CH4}** global warming potential of CH₄, in tCO₂e/tCH₄;
- **$EF_{N20,i}$** emission factor of N₂O resulting from co-processing of waste i, in tN₂O;
- **GWP_{N20}** global warming potential of N₂O, in tCO₂e/tN₂O.

GHG emissions from waste incineration were calculated using data on the waste produced that was incinerated in 2020, in tons. Emissions are calculated using the following equation:

$$E_{CO2,i,y} = m_{i,y} \cdot CC_i \cdot \frac{44}{12} + m_{i,y} \cdot EF_{CH4,i} \cdot GWP_{CH4} + m_{i,y} \cdot EF_{N20,i} \cdot GWP_{N20}$$

Where:

- **i** waste type;
- **y** reference year of the report;
- **$E_{CO2,i,y}$** CO₂ emissions resulting from incineration of waste i during the year y, in tCO₂e;
- **$m_{i,y}$** waste mass produced in the year y, in the unit of measurement u, with u being given in t;
- **CC_i** carbon content in waste i, dimensionless;
- **$EF_{CH4,i}$** emission factor of CH₄ resulting from incineration of waste i, in tCH₄;
- **GWP_{CH4}** global warming potential of CH₄, in tCO₂e/tCH₄;

- $EF_{N20,i}$ emission factor of N₂O resulting from incineration of waste *i*, in tN₂O;
- GWP_{N20} global warming potential of N₂O, in tCO₂e/tN₂O.

GHG emissions from landfills were calculated using data on the waste that was sent to landfills in 2020, in tons. CH₄ emissions produced in landfills are calculated using the following equation:

$$E_{CH4,y} = QR_y \cdot L_{0,y} \cdot (1 - OX_0)$$

$$L_{0,y} = MCF_0 \cdot DOC_{mean} \cdot DOC_f \cdot F_{CH4} \cdot \frac{16}{12}$$

$$DOC_{mean} = \sum (\%_{i,y} \cdot DOC_i)$$

Where:

- y reference year of the report;
- i waste type;
- $E_{CH4,y}$ CH₄ emissions attributable to decomposition of the waste disposed in landfills in year *y*, in t CH₄;
- AW_y amount of waste sent to landfills in year *y*, in t;
- $L_{0,y}$ methane generation potential in year *y*, in t CH₄/ t waste;
- OX_0 oxidation factor, dimensionless;
- MCF_0 methane correction factor based on landfill quality, dimensionless;
- DOC_{mean} mean value of industrial degradable organic carbon (default value of 0.04 according to IPCC 2006);
- DOC_i degradable organic carbon in waste *i*;
- $\%_{i,y}$ fraction of the amount of waste *i* in year *y*;
- $DOC_{f,y}$ fraction of waste that decomposes, dimensionless (default value of 50%, according to IPCC 2006);
- F_{CH4} fraction of methane in biogas, dimensionless (default value of 50%, according to IPCC 2006);
- $16/12$ mass conversion of C into CH₄, 1.33;

Values of OX_0 and MCF_0 were obtained from IPCC 2006 for uncategorized landfills. Overall, there is no methane recovery in landfills or anaerobic reactors in Brazil, and thus such recovery was not considered in the inventory.

B.7 CALCULATION OF UNCERTAINTIES

The equations used to calculate combined uncertainties are provided below, as are estimates in confidence intervals and the corrections that were made whenever necessary, according to the IPCC Good Practice Guidance (2006).

Combining uncertainties of components (not correlated) of a multiplication:

$$U_{total} = \sqrt{U_1^2 + U_2^2 + \dots + U_n^2}$$

Where:

- **U_{total}** : the total percentage uncertainty in the product of quantities (half the 95 percent confidence interval expressed as percentage). To asymmetric confidence intervals, the value considered is the larger percentage difference between the mean and the confidence limit;
- **U_i** : the percentage uncertainties associated with each of the quantities of a multiplication.

Combining uncertainties of components (not correlated) of an addition or subtraction:

$$U_{total} = \frac{\sqrt{(U_1 \cdot x_1)^2 + (U_2 \cdot x_2)^2 + \dots + (U_n \cdot x_n)^2}}{|x_1 + x_2 + \dots + x_n|}$$

Where:

- **U_{total}** : the total percentage uncertainty in the sum or subtraction of the quantities (half the 95 percent confidence interval expressed as percentage). To asymmetric confidence intervals, the value considered is the larger percentage difference between the mean and the confidence limit;
- **x_i and U_i** : the uncertainty quantities and the percentage uncertainties associated with each one of the quantities in a multiplication.

By means of the propagation of uncertainty model described above, an estimate of half the 95% confidence interval was produced and expressed as a percentage of the inventory result. As the inventory uncertainty increases, the propagation approach detailed above systematically underestimates the uncertainty, except in cases where the quantification models are purely additive. Therefore, in cases where uncertainty is higher than 100% and lower than 230%, the uncertainty must be corrected by the procedures described below:

$$U_{corrected} = U \cdot F_c$$

$$F_c = \left[\frac{(-0,720 + 1,0921 \cdot U - 1,63 \cdot 10^{-3} \cdot U^2 + 1,11 \cdot 10^{-5} \cdot U^3)}{U} \right]^2$$

Where:

- $U_{corrected}$: corrected total uncertainty (half the 95 percent confidence interval expressed as percentage);
- U : uncorrected total uncertainty (half the 95 percent confidence interval expressed as percentage);
- F_c : uncertainty correction factor.

To calculate the confidence intervals of the total result using the model based on the mean and on half the 95 percent confidence interval of the component quantities, a distribution must be assumed. If the model is purely additive and half the confidence interval is lower than 50%, a normal distribution is often an accurate estimate. In this case, a symmetric probability distribution can be assumed. For multiplicative models or in cases where uncertainty is higher than 50% for variables that must be non-negative, a lognormal distribution is typically an accurate assumption. In these cases, the probability distribution is not symmetric with respect to the mean. For such situations, the following equations were then used to calculate the upper and lower limits of the 95% confidence interval:

$$U_{low} = \left\{ \frac{\exp[\ln(\mu_g) - 1,96 \cdot \ln(\sigma_g)] - \mu}{\mu} \right\} \cdot 100$$

$$U_{high} = \left\{ \frac{\exp[\ln(\mu_g) + 1,96 \cdot \ln(\sigma_g)] - \mu}{\mu} \right\} \cdot 100$$

$$\sigma_g = \exp. \left\{ \sqrt{\ln \left(1 + \left[\frac{U}{100} \right]^2 \right)} \right\}$$

$$\mu_g = \exp. \left\{ \ln(\mu) - \frac{1}{2} \cdot \ln \left(1 + \left[\frac{U}{100} \right]^2 \right) \right\}$$

Where:

- **U_{low}** : lower limit of the 95% confidence interval, in %;
- **U_{high}** : upper limit of the 95% confidence interval, in %;
- **μ_g** : geometric mean;
- **μ** : arithmetic mean;
- **σ_g** : geometric standard deviation;
- **U** : symmetric total uncertainty of the 95% confidence interval, in %;

APPENDIX C - 2020 GHG INVENTORY EMISSION FACTORS

All calculation logs of emission factors can be found in the CLIMAS system. To access them, follow the steps below:

1. Access CLIMAS;
2. In “Emissões de GEE” [‘GHG Emissions’], select “Auditoria – Extrato de fatores de emissão” [‘Audit - Statement of emission factors’];
3. Choose the inventory and click “Obter extrato” [‘Obtain statement’] to generate the report;
4. In the last table (“Fatores de emissão”) [‘Emission factors’], select the emission factor in the columns “Tecnologia/Precursor” [‘Technology/Precursor’] and click the “Ver” [‘See’] button in the last column (“Medidas de fator”) [‘Factor measurements’];
5. In the new window, click “Memorial” [‘Log’] (last column) to verify how the emission factor was constructed and where its data was retrieved from.

Calculation logs have a detailed description, as in the following example:

tCO₂/Gm

Given:

Variable	Description	Value	Unit	Reference	Remark	Validity start	Validity end
FC	Diesel consumption in road bus	3, [-0.00%, +0.00%]	km/L	PBGHGP 2016	Sheet "Emission factors" (Fatores de emissão), Section 3, Table 8.		
EFCO2Diesel	CO2 emission factor for combustion of diesel oil	74100, [-2.02%, +0.94%]	kg/TJ	IPCC 2006	V2 CH3 table 3.5.2		
NCVdiesel	Net calorific value of diesel oil	43, [-3.72%, +0.70%]	TJ/Gg	IPCC 2006	V2 CH1 table 1.2		
DensityDiesel	Density of diesel oil	840, [-0.00%, +0.00%]	kg/m3	BEN 2015	Page 224, "Table VIII.9 – Specific Mass and Heating Values – 2014"		
FracBio	Percentage of biodiesel added to diesel in Brazil	0.07, [-0.00%, +0.00%]	Dimensionless	PBGHGP 2016		Nov/2014	

Then:

$$\frac{(1 - \text{FracBio}) \cdot \text{DensityDiesel} \cdot \text{NCVdiesel} \cdot \text{EFCO2Diesel}}{(\text{FC} \cdot 10^6)} = 829.7125200000^{+1.17\%}_{-4.24\%}$$

The major emission and conversion factors used to calculate scope 1, 2 and 3 emissions for the CEMIG 2020 GHG inventory are given below.

Table C1. Global Warming Potentials (GWPs)

Gas	GWP
CO ₂	1
CH ₄	25
N ₂ O	298
SF ₆	22,800

Table C2. Emission Factors – Electricity – 2020

Country	EFCO ₂ (t/MWh)	EFCH ₄ (t/MWh)	EFN ₂ O (t/MWh)	Source
Brazil	0.0617	-	-	MCTIC, 2020

Table C3. Conversion Factors – Mobile Combustion

Transport data	Factor	Unit	Source
Diesel oil - commercial vehicle	10.5	km/L	PBGHGP 2020
Diesel oil - heavy truck	3.4	km/L	PBGHGP 2020
Diesel oil - light and medium trucks	5.6	km/L	PBGHGP 2020

Table C4. Emission Factors – Air Travel

Air travel	EFCO ₂	EFCH ₄	EFN ₂ O	Unit	Source
Air travel - long distance	94.851900	0.000370	0.003014	t/pax*Gm	PBGHGP 2020
Air travel - medium distance	76.768500	0.000370	0.002424	t/pax*Gm	PBGHGP 2020
Air travel - short distance	123.565000	0.004444	0.003915	t/pax*Gm	PBGHGP 2020

Table C5. Specific Masses and Lower Heating Values (LHVs)

Precursor	Specific mass (kg/m ³)	LHV (kcal/kg)	Source
Biodiesel (B100)	880	9,000	BEN, 2020
Hydrous ethanol	809	6,300	BEN, 2020
Natural gas	0.74	8,800	BEN, 2020
Automotive gasoline	742	10,400	BEN, 2020
Diesel oil	840	10,100	BEN, 2020
Aviation kerosene	799	10,400	BEN, 2020

Table C6. Emission Factors – Mobile and Stationary Sources

Precursor	EFCO ₂	EFCH ₄	EFN ₂ O	Unit	Source
Natural gas	56,100			kg/TJ	IPCC, 2006
Natural gas - mobile combustion		92.0	3.0	kg/TJ	IPCC, 2006
Biodiesel	2.431			tCO ₂ /m ³	IPCC, 2006
Biodiesel - mobile combustion		0.000332	0.00002	tGHG/m ³	IPCC, 2006
Biodiesel - stationary combustion - commercial / institutional		10.0	0.6	kg/TJ	IPCC, 2006
Diesel oil	74,100			kg/TJ	IPCC, 2006
Diesel oil - mobile combustion		3.9	3.9	kg/TJ	IPCC, 2006
Diesel oil - stationary combustion - commercial / institutional		10.0	0.6	kg/TJ	IPCC, 2006
Ethanol	1.457			t/m ³	IPCC, 2006
Ethanol - mobile combustion		0.000384	0.000013	t/m ³	IPCC, 2006
Gasoline	69,300			kg/TJ	IPCC, 2006
Gasoline - mobile combustion		25.0	8.0	kg/TJ	IPCC, 2006
Aviation kerosene	71,500			kg/TJ	IPCC, 2006
Fuel combustion - civil aviation		0.5	2.0	kg/TJ	IPCC, 2006

APPENDIX D - EMISSIONS BY EMISSION SOURCE

Table D1. Scope 1 emissions by source (Kyoto - tCO₂e), with the respective responsible staff member

Operating unit	Parameter	Responsible	Emissions (tCO ₂ e)
CEMIG D	Alcohol consumption – company’s own fleet	Ormindo Coutinho Filho	2.30
	S10 diesel consumption – company’s own fleet		4,942.27
	S500 diesel consumption – company’s own fleet		870.58
	Gasoline consumption – company’s own fleet		669.58
	VNG consumption – company’s own fleet		1.05
	Diesel oil consumption by generators (Distribution)		157.85
	Aviation kerosene consumption by the company’s fleet	Vinicius Vieira Sales	128.68
	NG consumption by stationary sources (restaurant)	Pedro Henrick	0.94
	NG consumption by generators (A. Chaves Bldg. and J. Soares Bldg.)		6.75
	Diesel oil consumption by generators (headquarters)		0.31
	Use of insulating gases – leak of SF6	João Carlos Oliveira da Silva	2,231.21
	CO ₂ consumption by fire extinguishers	Geraldo Vinicius Ferreira	3.68
	LPG consumption by forklift trucks	Júlio Henrique Costa Guimarães	1.35
	NG consumption by stationary sources (autoclave)		5.95
CEMIG GT	Alcohol consumption – company’s own fleet	Ormindo Coutinho Filho	0.83
	S10 diesel consumption – company’s own fleet		657.32
	S500 diesel consumption – company’s own fleet		165.79
	Gasoline consumption – company’s own fleet		285.64
	VNG consumption – company’s own fleet		0.13
	Diesel oil consumption by generators (Transmission)		17.93
	Aviation kerosene consumption by the company’s fleet	Vinicius Vieira Sales	68.96
	Alcohol consumption – leased fleet	Clara Silva	0.00
	Limestone consumption		1.44
	Diesel consumption – leased fleet		13.31
	Diesel consumption by ships		0.00
	Gasoline consumption – leased fleet		59.99
	Gasoline consumption by ships		0.53
	Nitrogen consumption in fertilizers		2.73
	Diesel oil consumption by generators		6.17
Diesel oil consumption by generators (Generation)	2.36		
CO ₂ consumption by fire extinguishers	Geraldo Vinicius Ferreira		2.76
Use of insulating gases – leak of SF6	Rômulo Miranda Teixeira	722.30	

Operating unit	Parameter	Responsible	Emissions (tCO ₂ e)
CEMIG SIM	Alcohol consumption – company’s own fleet	Ormindo Coutinho Filho	0.01
	Gasoline consumption – company’s own fleet		1.18
CENTROESTE	Vegetation removal	Alexandre Duarte Barhouch	26.71
GASMIG	Alcohol consumption – company’s own fleet	Luciana da Cunha Correa	0.11
	CO ₂ consumption by fire extinguishers		0.01
	Diesel consumption – company’s own fleet		0.47
	Gasoline consumption – company’s own fleet		5.46
	VNG consumption – company’s own fleet		52.29
	Diesel oil consumption by generators		0.17
	Leak of natural gas in transport		302.27
TOTAL – Scope 1			11,419.36

	Transport in medium-haul air travels		2.10
TOTAL – Scope 3			5,246,667.72

APPENDIX E - CATEGORIES IN THE BRAZIL GHG PROTOCOL PROGRAM

The Brazil GHG Protocol Program defines the following emissions categories:

- **Stationary combustion (Scope 1):** GHG emissions resulting from fuel burning, which generates energy that is mainly used to produce steam or electricity. This energy is not used to fuel means of transport. E.g., furnaces, burners, heaters and generators.
- **Mobile combustion (Scope 1):** GHG emissions resulting from fuel burning, which generates energy that is used to produce movement and travel a given distance. E.g.: cars, motorcycles, trucks, buses, tractors, fork lifts, airplanes and trains.
- **Fugitive emissions (Scope 1):** GHG leaks, usually non-intentional, that occur during production, processing, transmission, storage or use of gas. E.g., fire extinguishers (CO₂) and leaks in refrigerant equipment and air conditioners (HFC or PFC).
- **Land-use change (Scope 1):** non-mechanical GHG emissions resulting from agricultural or stockbreeding activities, or from activities that promote any change in soil use.
- **Purchased electricity (Scope 2):** GHG emissions resulting from generation of electricity that was purchased by the company or related to the portion of electricity lost in the transmission and distribution systems.
- **Category 1: Purchased goods and services (Scope 3):** goods or services, purchased by the company from third parties, which generate GHG emissions.
- **Category 4: Upstream transport and distribution (Scope 3):** emissions from transport and distribution of products purchased or acquired by the company, in vehicles and installations that are not owned nor operated by it, as well as of other outsourced services of transport and distribution (including inbound and outbound logistics).
- **Category 5: Waste generated in operations (Scope 3):** includes emissions from treatment and/or final disposal of solid waste and wastewater resulting from the company's operations controlled by third-parties. This category considers all future emissions (along the process of treatment and/or final disposal) that result from the waste generated in the inventoried year.
- **Category 6: Business travel (Scope 3):** emissions from the transport of employees to activities related to the company's business, which is made by vehicles operated or owned by third-parties, such as airplanes, trains, buses, passenger automobiles or ships. This category

considers all employees from entities and units that are operated, rented or owned by the company. It may also include employees from other relevant entities (e.g., outsourced service providers), as well as consultants and other individuals that are not employed by the company yet take transport to its facilities.

- **Category 7: Employee commuting (Scope 3):** emissions in this category include transport of employees from their homes to the workplace. They also include transport by car, bus, train and other modes of urban transportation.
- **Category 9: Downstream transport and distribution (Scope 3):** emissions from the transport and distribution of products sold by the company (if not paid for by it) between its operations and the final customer, including retail and storage, in vehicles and third-party facilities.
- **Category 11: Use of sold goods and services (Scope 3):** emissions from the use of a given good or service sold by the company.

APPENDIX F - AUDITOR'S CERTIFICATE

STATEMENT

The Bureau Veritas Certification, established at Avenida Alfredo Egídio de Souza Aranha, 100, 4th floor, Torre C, Vila Cruzeiro, São Paulo / SP, enrolled in the National Registry of Legal Entities under No. 72.368.012 / 0002-65, states for appropriate action that CEMIG – Companhia Energética de Minas Gerais, established at Av. Barbacena, 1200 – 17th floor, wing A1, Belo Horizonte, Minas Gerais, entered in the CNPJ (National Register of Legal Entities) under number 17.155.730/0001-64, in the city of Belo Horizonte, Minas Gerais, is authorized to publish in all its titles and sites the excerpt of the Verification Declaration as drafted at following: "Bureau Veritas Certification, based on the processes and procedures described in its Verification Report, adopting a reasonable level of confidence, declares that the Greenhouse Gas Inventory - 2020 inventoried year of the CEMIG – Companhia Energética de Minas Gerais, is precise, reliable and error-free or distortion-free and is an equitable representation of GHG data and information over the reference period, for the defined scope; was prepared in accordance with the specifications of NBR ISO 14064-1 and the Brazilian GHG Protocol Program. "
